Title: Designing innovative sustainable neighbourhoods / Avi Friedman.

Description: New York, NY : Routledge, 2022. | Includes bibliographical references and index. | Summary: "This book covers the key principles of residential planning and offers principles for sustainable neighbourhood design. Written by a designer and instructor, the book's fully illustrated chapters provide detailed insights into contemporary strategies that architects, planners and builders are integrating into their thought processes and residential design practices. Past approaches to planning and design modes of dwellings and neighbourhoods can no longer sustain new demands and require innovative thinking. This book explores new outlooks on neighbourhood design, which are propelled by fundamental changes that touch upon environmental, economic and social aspects. It presents contemporary well-designed and illustrated examples of communities and detailed analysis of topics including the depletion of non-renewable natural resources, elevated levels of greenhouse gas emissions and climate change. It also explores the increasing costs of material, labour, land and infrastructure that have posed economic challenges, as well as social challenges including the need for walkable communities and the increase of live-work environments. The need to think innovatively about neighbourhoods is at the core of this book, which will be useful to students and practitioners of urban design, urban planning, geography, and urban systems and architecture studios focused on sustainable residential development"—Provided by publisher.
