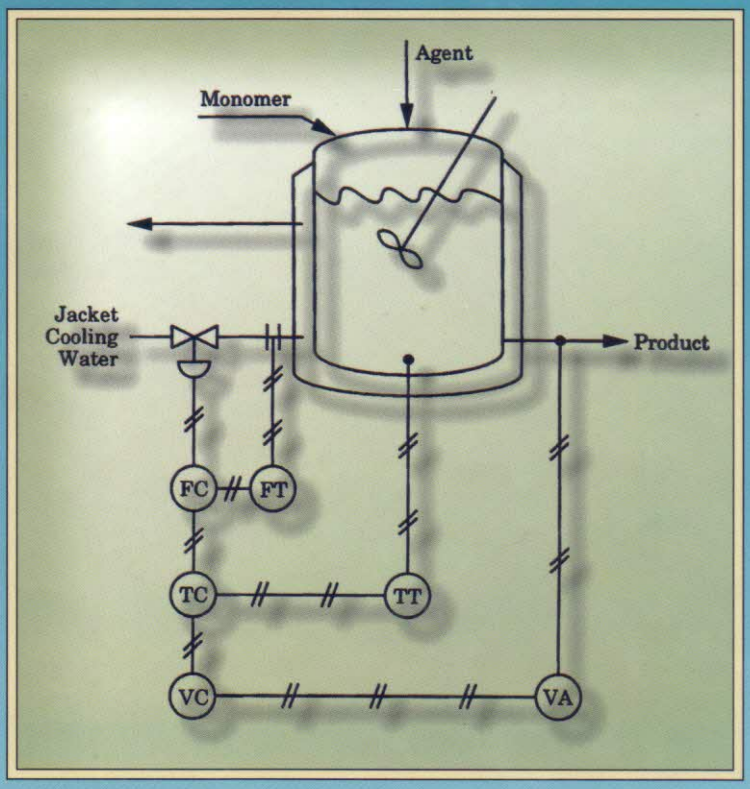
Process Dynamics, Modeling, and Control



Babatunde A. Ogunnaike
W. Harmon Ray

CONTENTS

part I

INTRODUCTION

Chapter 1. Introductory Concepts of Process Control 5

1.1 The Chemical Process 5
1.2 An Industrial Perspective of a Typical Process Control Problem 8
1.3 Variables of a Process 13
1.4 The Concept of a Process Control System 15
1.5 Overview of Control System Design 19
1.6 Summary 30

Chapter 2. Introduction to Control System Implementation 35

2.1 Introduction 35
2.2 Historical Overview 36
2.3 Basic Digital Computer Architecture 38
2.4 Data Acquisition and Control 46
2.5 Some Examples 56
2.6 Summary 61

part II

PROCESS DYNAMICS

Chapter 3. Basic Elements of Dynamic Analysis 67

3.1 Introduction 67
3.2 Tools of Dynamic Analysis 68
3.3 The Laplace Transform 71
3.4 Characteristics of Ideal Forcing Functions 80
3.5 Summary 86

Chapter 4. The Process Model 89

4.1 The Mathematical Description of Chemical Processes 89
4.2 Formulating Process Models 92
4.3 State-Space Models 104
4.4 Transform-Domain Models 108
4.5 Frequency-Response Models 110
4.6 Impulse-Response Models 111
4.7 Interrelationships between Process Model Forms 115
4.8 The Concept of a Transfer Function 128
4.9 Summary 134

Chapter 5. Dynamic Behavior of Linear Low Order-Systems 139

5.1 First Order Systems 139
5.2 Response of First-Order Systems to Various Inputs 142
5.3 Pure Gain Systems 153
5.4 Pure Capacity Systems 157
5.5 The Lead/Lag System 161
5.6 Summary 166

Chapter 6. Dynamic Behavior of Linear Higher Order Systems 175

6.1 Two First-Order Systems in Series 175
6.2 Second-Order Systems 183
6.3 Response of Second-Order Systems to Various Inputs 188
6.4 *N* First-Order Systems in Series 200
6.5 The General *N*th-Order System 204
6.6 Higher Order Systems with Zeros 205
6.7 Summary 211

Chapter 7. Inverse-Response Systems 225

7.1 Introduction 225
7.2 Inverse Response in Physical Processes 229
7.3 Dynamic Behavior of Systems with Single, Right-Half Plane Zeros 231
7.4 Dynamic Behavior of Systems with Multiple, Right-Half Plane Zeros 237
7.5 Summary 240

Chapter 8. Time-Delay Systems 245

8.1 An Introductory Example 245
8.2 The Pure Time-Delay Process 249
8.3 Dynamic Behavior of Systems with Time Delays 252
8.4 The Steam-Heated Heat Exchanger 257
8.5 Rational Transfer Function Approximations 261
8.6 Model Equations for Systems Containing Time Delays 265
8.7 Summary 267

Chapter 9. Frequency-Response Analysis 275

9.1 Introduction 275
9.2 A General Treatment 277
9.3 Low-Order Systems 288
9.4 Higher Order Systems 295
9.5 Frequency Response of Feedback Controllers 305
9.6 Summary 306

Chapter 10. Nonlinear Systems 311

10.1 Introduction: Linear and Nonlinear Behavior in Process Dynamics 312
10.2 Some Nonlinear Models 313
10.3 Methods of Dynamic Analysis of Nonlinear Systems 314
10.4 Linearization 320
10.5 Summary 326

Chapter 11. Stability 333

11.1 Introductory Concepts of Stability 333
11.2 Stability of Linear Systems 337
11.3 Stability of Nonlinear Systems 343
11.4 Dynamic Behavior of Open-Loop Unstable Systems 349
11.5 Stability of Dynamic Systems under Feedback Control 353
11.6 Summary 355

part III

PROCESS MODELING AND IDENTIFICATION

Chapter 12.	**Theoretical Process Modeling**	363
12.1	Introduction	363
12.2	Development of Theoretical Process Models	366
12.3	Examples of Theoretical Model Formulation	368
12.4	Parameter Estimation in Theoretical Models	380
12.5	Validation of Theoretical Models	399
12.6	Summary	401
Chapter 13.	**Process Identification: Empirical Process Modeling**	409
13.1	Introduction and Motivation	409
13.2	Principles of Empirical Modeling	412
13.3	Step-Response Identification	417
13.4	Impulse-Response Identification	422
13.5	Frequency-Response Identification	436
13.6	Issues for Multivariable Systems	447
13.7	Summary	450

part IV

PROCESS CONTROL

PART IVA: SINGLE-LOOP CONTROL

Chapter 14.	**Feedback Control Systems**	461
14.1	The Concept of Feedback Control	461
14.2	Block Diagram Development	464
14.3	Classical Feedback Controllers	467
14.4	Closed-Loop Transfer Functions	468
14.5	Closed-Loop Transient Response	472
14.6	Closed-Loop Stability	486
14.7	The Root Locus Diagram	496
14.8	Summary	504
Chapter 15.	**Conventional Feedback Controller Design**	513
15.1	Preliminary Considerations	513
15.2	Controller Design Principles	519
15.3	Controller Tuning with Fundamental Process Models	525
15.4	Controller Tuning using Approximate Process Models	532
15.5	Controller Tuning using Frequency-Response Models	541
15.6	Controller Tuning without a Model	555
15.7	Summary	557
Chapter 16.	**Design of More Complex Control Structures**	565
16.1	Processes with Significant Disturbances	565
16.2	Processes with Multiple Outputs Controlled by a Single Input	581
16.3	Processes with a Single Output Controlled by Multiple Inputs	582
16.4	Antireset Windup	585
16.5	Summary	586
Chapter 17.	**Controller Design for Processes with Difficult Dynamics**	599
17.1	Difficult Process Dynamics	599
17.2	Time-Delay Systems	603
17.3	Inverse-Response Systems	608
17.4	Open-Loop Unstable Systems	617
17.5	Summary	619

Chapter 18. Controller Design for Nonlinear Systems 625

18.1 Nonlinear Controller Design Philosophies 625
18.2 Linearization and the Classical Approach 626
18.3 Adaptive Control Principles 628
18.4 Variable Transformations 632
18.5 Summary 638

Chapter 19. Model-Based Control 645

19.1 Introduction 645
19.2 Controller Design by Direct Synthesis 648
19.3 Internal Model Control 665
19.4 Generic Model Control 671
19.5 Optimization Approaches 674
19.6 Summary 675

PART IVB: MULTIVARIABLE PROCESS CONTROL

Chapter 20. Introduction to Multivariable Systems 683

20.1 The Nature of Multivariable Systems 683
20.2 Multivariable Process Models 688
20.3 Open-Loop Dynamic Analysis in State Space 694
20.4 Multivariable Transfer Functions and Open-Loop Dynamic Analysis 702
20.5 Closed-Loop Dynamic Analysis 712
20.6 Summary 716

Chapter 21. Interaction Analysis and Multiple Single Loop Designs 723

21.1 Introduction 723
21.2 Preliminary Considerations of Interaction Analysis and Loop Pairing 724
21.3 The Relative Gain Array (RGA) 728
21.4 Loop Pairing Using the RGA 735
21.5 Loop Pairing for Nonlinear Systems 742
21.6 Loop Pairing for Systems with Pure Integrator Modes 748
21.7 Loop Pairing for Nonsquare Systems 750
21.8 Final Comments on Loop Pairing and the RGA 754
21.9 Controller Design Procedure 759
21.10 Summary 764

Chapter 22. Design of Multivariable Controllers 773

22.1 Introduction 773
22.2 Decoupling 776
22.3 Feasibility of Steady-State Decoupler Design 792
22.4 Steady-State Decoupling by Singular Value Decomposition 805
22.5 Other Model-Based Controllers for Multivariable Processes 806
22.6 Summary 807

PART IVC: COMPUTER PROCESS CONTROL

Chapter 23. Introduction to Sampled-Data Systems 821

23.1 Introduction and Motivation 821
23.2 Sampling and Conditioning of Continuous Signals 825
23.3 Continuous Signal Reconstruction 830
23.4 Mathematical Description of Discrete-Time Systems 832
23.5 Theoretical Modeling of Discrete-Time Systems 835
23.6 Empirical Modeling of Discrete-Time Systems 838
23.7 Summary 843

Chapter 24. Tools of Discrete-Time Systems Analysis 847

24.1 Introduction 847
24.2 The Basic Concepts of z-Transforms 848
24.3 Inverting z-Transforms 860
24.4 Pulse Transfer Functions 867
24.5 Summary 877

Chapter 25. Dynamic Analysis of Discrete-Time Systems 883

25.1 Open Loop Responses 883
25.2 Characteristics of Open-Loop Pulse Transfer Functions 893
25.3 Block Diagram Analysis for Sampled-Data Systems 917
25.4 Stability 933
25.5 Summary 943

Chapter 26. Design of Digital Controllers 951

26.1 Preliminary Considerations 951
26.2 The Digital Controller and Its Design 953
26.3 Discrete PID Controllers from the Continuous Domain 960
26.4 Other Digital Controllers Based on Continuous Domain Strategies 964
26.5 Digital Controllers Based on Discrete Domain Strategies 970
26.6 Digital Multivariable Controllers 979
26.7 Summary 979

part V

SPECIAL CONTROL TOPICS

Chapter 27.	**Model Predictive Control**	99
27.1	Introduction	99
27.2	General Principles of Model Predictive Control	99
27.3	Dynamic Matrix Control	100
27.4	Model Algorithmic Control (MAC)	100
27.5	Commercial Model Predictive Control Schemes: A Qualitative Review	101
27.6	Academic and Other Contributions	101
27.7	Nonlinear Model Predictive Control	102
27.8	Closing Remarks	102
27.9	Summary	102
Chapter 28.	**Statistical Process Control**	103
28.1	Introduction	103
28.2	Traditional Quality Control Methods	103
28.3	Serial Correlation Effects and Standard Process Control	104
28.4	When is Traditional SPC Appropriate?	104
28.5	Stochastic Process Control	105
28.6	More Advanced Multivariate Techniques	105
28.7	Summary	105
Chapter 29.	**Selected Topics in Advanced Process Control**	106
29.1	Control in the Absence of Good On-line Measurements — State Estimation	106
29.2	Control in the Face of Process Variability and Plant/Model Mismatch — Robust Controller Design	106
29.3	Control of Spatial Profiles — Distributed Parameter Controllers	108
29.4	Control in a Changing Economic Environment — On-line Optimization	108
29.5	Control in the Face of Component Failure — Abnormality Detection, Alarm Interpretation, and Crisis Management	108
29.6	Some Emerging Technologies for Advanced Process Control	108
29.7	Concluding Remarks	109

Chapter 30. Process Control System Synthesis — Some Case Studies 1097

30.1 Control of Distillation Columns 1097
30.2 Control of Catalytic Packed Bed Reactors 1105
30.3 Control of a Solution Polymerization Process 1113
30.4 Control of an Industrial Terpolymerization Reactor 1122
30.5 Guidelines for Characterizing Process Control Problems 1133
30.6 Summary 1145

part VI

APPENDICES

Appendix A. Control System Symbols used in Process and Instrumentation Diagrams 1149

Appendix B. Complex Variables, Differential Equations, and Difference Equations 1155

Appendix C. Laplace and *Z*-Transforms 1177

Appendix D. Review of Matrix Algebra 1209

Appendix E. Computer-Aided Control System Design 1249
