circular storage tanks and silos

A. Ghali \ Second Edition

Contents

Preface to second edition xi
Preface to first edition xiii
The SI system of units and British equivalents xv
Notation xvii

PART I
Analysis 1

1 Introduction to the analysis of circular tanks **3**
1.1 Scope 3
1.2 Basic assumptions 4
1.3 General methods of structural analysis 4
1.4 The displacement method 5
1.5 The force method 7
1.6 Flexibility and stiffness matrices 8
1.7 Moment distribution 9
1.7.1 Notation and sign convention 10
1.7.2 Steps of analysis 11
1.8 Adjusted stiffness and flexibility coefficients 11
1.9 General 13

2 Circular walls of constant thickness **15**
2.1 Introduction 15
2.2 Beam-on-elastic-foundation analogy 15
2.3 General solution of the differential equation of the deflection of a wall of constant thickness 18
2.4 Characteristic parameters 20
2.5 Stiffness and flexibility matrices 21
2.6 End-rotational stiffness and carry-over factor 24

2.7 Fixed-end forces 25
2.7.1 Uniform or linearly varying load 25
2.7.2 Concentrated load 26
2.7.3 Couple 28
2.8 Semi-infinite beam on elastic foundation and simplified equations for long cylinders 29
2.9 Classification of beams on elastic foundation and circular walls as long or short 32
2.10 Examples 32
Example 2.1 Circular wall, hinged at the bottom 32
Example 2.2 Circular wall, on bearing pads 34
Example 2.3 Circular wall, with thickness change 35
2.11 General 39

3 Circular walls of varying thickness 40
3.1 Introduction 40
3.2 Finite-difference equations 41
3.3 Boundary conditions and reactions 45
3.4 Generation of simultaneous equations 47
3.5 Sudden change in thickness 47
3.6 Examples 48
Example 3.1 Circular wall, on bearing pads, with linearly varying load 48
Example 3.2 Circular wall, with bottom edge encastré and top edge hinged 50
3.7 Flexibility and stiffness of circular walls of variable thickness 52
3.8 Effect of temperature 53
3.9 General 57

4 Design tables and examples of their use 58
4.1 Introduction 58
4.2 Description of design tables 58
4.3 Variables 61
4.4 Arbitrary edge conditions 61
4.5 Examples 62
Example 4.1 Circular wall of varying thickness, on bearing pads, with trapezoidal normal load 62
Example 4.2 Circular wall, with circumferential prestressing tendons 64

Example 4.3 Reinforced tank, on rigid foundation 67
Example 4.4 Circular wall, with variable thickness, subjected to temperature rise varying linearly through the thickness 72
4.6 Long cylinders 79
Example 4.5 Circular wall, fixed at the base and free at the top 81
4.7 Poisson's ratio 82
4.8 Beams on elastic foundations 82
4.9 General 84

5 Finite-element analysis 85
5.1 Introduction 85
5.2 Nodal displacements and nodal forces 85
5.3 Transformation of stiffness matrix 89
5.4 Displacement interpolations 89
5.5 Stress resultants 90
5.6 Stiffness matrix of individual element 91
5.7 Analysis for effect of temperature 92
5.8 Assemblage of stiffness matrices and load vectors 93
5.9 Nodal forces 95
5.10 Examples 96
Example 5.1 Cylindrical wall, with uniform radial force on bottom edge 96
Example 5.2 Cylindrical wall, bottom edge encastré and top edge free, with temperature rise 98
Example 5.3 Circular plate, with outer edge encastré, subjected to uniform load 99
Example 5.4 Circular cylinder, monolithic with spherical dome 100

6 Time-dependent effects 102
6.1 Introduction 102
6.2 Creep and shrinkage of concrete 102
6.3 Relaxation of prestressed steel 106
6.4 Basic equations for stress and strain distributions in a homogeneous section 106
6.5 Time-dependent stress and strain in a section 109
6.5.1 Special case: section subjected to axial force only 112

Example 6.1 Time-dependent stresses in a prestressed section: effect of presence of non-prestressed steel 114
6.6 Normal force N and bending moment M due to prestressing 115
6.6.1 Circumferential prestressing 116
6.6.2 Vertical prestressing of a circular-cylindrical wall 117
Example 6.2 Internal forces due to vertical prestressing of a circular wall 118
6.7 Time-dependent internal forces 119
Example 6.3 Time-dependent internal forces in a cylindrical wall on elastomeric pads 122
Example 6.4 Time-dependent internal forces in a cylindrical tank wall monolithic with base 126

7 Thermal stresses **131**
7.1 Introduction 131
7.2 Effects of temperature variation in a cylindrical wall 133
7.3 Linear temperature variation through wall thickness 135
7.4 Thermal internal forces in deep tanks and silos 135
7.4.1 Bottom edge encastré and top edge free 136
7.4.2 Bottom edge hinged and top edge free 136
7.4.3 Bottom edge free to slide and rotate and top edge free 136
Example 7.1 Thermal stresses in a cylindrical concrete wall 137
7.5 Internal forces due to shrinkage of concrete 142
Example 7.2 Shrinkage stresses in a cylindrical concrete wall 142
7.6 Significance of linear analysis 145

8 Optimum design of prestressing **146**
8.1 Introduction 146
8.2 Trapezoidal distribution of circumferential prestressing 146
Example 8.1 Trapezoidal distribution of circumferential prestressing; cylindrical wall encastré at the bottom edge 148
8.3 Improved distribution of circumferential prestressing 149
Example 8.2 Improved distribution of circumferential prestressing 150
8.4 Design objectives 153
8.5 Design of circumferential prestress distribution 154
Example 8.3 Design for distribution of circumferential prestressing 156

9 Effects of cracking of concrete **161**
9.1 Introduction 161
9.2 Stress and strain in a cracked section 161
9.3 Decompression forces 162
9.4 Equilibrium equations 163
9.5 Rectangular section analysis 165
9.6 Tension stiffening 166
9.7 Crack width 167
Example 9.1 Analysis of cracked prestressed section 169
9.8 Time-dependent strain and stress in cracked sections 173
9.9 Influence of cracking on internal forces 173

10 Control of cracking in concrete tanks and silos **176**
10.1 Introduction 176
10.2 Causes of cracking 177
10.3 Tensile strength of concrete 177
10.4 Force-induced cracking 178
10.4.1 Effect of prestressing 181
Example 10.1 Hoop force versus elongation for a circular reinforced concrete ring 182
10.5 Displacement-induced cracking 184
10.6 Cracking by bending: force-induced and displacement-induced 186
10.7 Motives for crack control 187
10.8 Means of controlling cracking 188
10.9 Minimum reinforcement to avoid yielding of reinforcement 188
10.10 Amount of reinforcement to limit crack width: displacement-induced cracking 191
Example 10.2 Reinforcement required to limit the width of cracks caused by temperature variation 192
10.11 Change in steel stress at cracking 193

PART II
Design tables **197**

11 Tables for analysis of circular walls of thickness varying linearly from top to bottom **199**

12 Tables for analysis of circular walls of thickness constant in upper part and varying linearly in lower three-tenths of height **260**

Appendix: Stiffness and fixed-end forces for circular and annular plates **320**
A.1 Governing differential equation 320
A.2 Stiffness and fixed-end moments of circular plates 321
A.3 Stiffness of annular plates 322
A.4 Fixed-end forces of annular plates 326
A.5 Approximate analysis for annular plates 327

Index 328
