

Corrosion Testing Made Easy

Stress Corrosion Cracking Test Methods

A. John Sedriks
B.C. Syrett, Series Editor

1. Introduction.....	1
Stress Corrosion Cracking Terminology	1
Constituents of a Stress Corrosion Cracking Test.....	2
Selection of a Stress Corrosion Cracking Test.....	2
Alloy Grain Orientation	4
Residual Stresses.....	6
Surface Condition	7
Weldments.....	8
2. Making and Using Uniaxially Loaded Tensile Specimens.....	11
Specimen Preparation	11
Constant Strain and Constant Load Tests.....	11
Testing Procedure.....	13
Assessment and Reporting of Results	14
Slow Strain Rate Tests.....	15
Definition of Parameters Used in Slow Strain Rate Testing	16
Testing Procedure.....	16
Assessment and Reporting of Results	17
3. Making and Using Bent-Beam Specimens	19
Two-Point Loaded Specimens	19
Three-Point Loaded Specimens.....	20
Four-Point Loaded Specimens.....	20
Double-Beam Specimens.....	21
Fully Supported Bent-Beam Specimens	21
Testing Bent-Beam Specimens.....	22
Assessment and Reporting of Results.....	23
4. Making and Using U-Bend Specimens	25
Specimen Preparation	25
Testing Procedure	28
Assessment and Reporting of Results.....	29
5. Making and Using C-Ring Specimens	31
Specimen Preparation	31
Stressing the Specimen	32
Stressing With Strain Gages Attached	33
Stressing Without Strain Gages.....	33
Stress Considerations	33
Testing Procedure	35
Assessment and Reporting of Results.....	35
6. Making and Using Precracked Cantilever Beam Specimens.....	37
Terminology	37
Ensuring Plane Strain Test Conditions	37
Specimen Preparation	39
Testing Procedure	41
Determination of K_{ISCC}	41
Reporting of Results.....	44

7. Making and Using Precracked Wedge Opening-Loaded Specimens.....	47
Specimen Preparation.....	48
Relationship Between Crack Opening Displacement and K_I	49
Testing Procedure.....	50
Reporting of Results.....	52
8. Measurement of Crack Velocities Using Precracked Specimens.....	53
Variation of Crack Velocity with K_I	53
Using the Compact Tension Specimen.....	54
Determining Crack Velocity by Visual Observation.....	55
Determining Crack Velocity from Crack Opening Displacement Measurements.....	56
Determining Crack Velocity from Load Decrease Measurements.....	57
Using the Double Cantilever Beam Specimen.....	58
Using the Wedge Opening-Loaded Specimen with an Instrumented Bolt.....	60
Using the Double Torsion Specimen.....	61
Reporting of Results.....	64
9. Making and Using Blunt Notched Specimens.....	67
Definition of Parameters.....	67
Using Plane Strain Blunt Notched Cantilever Beam and Compact Tension Specimens.....	68
Using Other Blunt Notched Specimens.....	70
10. Laboratory Environments for Stress Corrosion Testing.....	71
Preparation and Control of Test Solutions.....	71
Ambient Pressure-Ambient Temperature Tests.....	72
Electrochemical Stimulation.....	72
Specialized Tests.....	73
Ambient Pressure-Elevated Temperature Tests.....	73
Specialized Tests.....	75
Elevated Pressure-Elevated Temperature Tests.....	75
Static Autoclave Systems.....	76
Refreshed Autoclave Systems.....	78
11. Stress Corrosion Testing in Industrial and Natural Environments.....	81
Testing in Industrial Plant Under Operating Conditions.....	81
Testing in Seawater.....	82
Testing in Atmospheric Environments.....	83

CAUTION

The test methods described in this publication may involve hazardous materials, operations, and equipment. This publication does not purport to address all of the safety problems associated with the test methods. It is the responsibility of whoever uses these test methods to consult and establish appropriate safety and health practices and to determine the applicability of regulatory limitations before use.
