CHAPTER 1	PLATE AND SHELL BENDING APPROXIMATION: THIN (KIRCHHOFF) PLATES AND C_1 CONTINUITY REQUIREMENTS	1
1.1	Introduction	1
1.2	The plate problem: <i>thick</i> and <i>thin</i> formulations	3
1.3	Rectangular element with corner nodes (12 DOF)	15
1.4	Quadrilateral and parallelogram elements	20
1.5	Triangular element with corner nodes (9 DOF)	23
1.6	Triangular element of the simplest form (6 DOF)	27
1.7	The patch test—an analytical requirement	29
1.8	Numerical examples	30
1.9	General remarks	34
1.10	Singular shape functions for the simple triangular element	40
1.11	An 18 degree of freedom triangular element with conforming shape functions	45
1.12	Compatible quadrilateral elements	45
1.13	Quasi-conforming elements	47
1.14	Hermitian rectangle shape function	47
1.15	The 21 and 18 degree of freedom triangles	49
1.16	Mixed formulations—general remarks	51
1.17	Hybrid plate elements	54
1.18	Discrete Kirchhoff constraints	56
1.19	Concluding remarks—which elements?	60
CHAPTER 2	'THICK' REISSNER-MINDLIN PLATES—IRREDUCIBLE AND MIXED FORMULATIONS	66
2.1	Introduction	66
2.2	The irreducible formulation—reduced integration	69
2.3	Mixed formulation for thick plates and numerical integration equivalence	73

2.4	The patch test for plate bending elements	76
2.5	Elements with discrete collocation constraints	82
2.6	Performance of various 'thick' plate elements— limitations of thin plate theory	92
2.7	Concluding remarks—adaptive refinement	98
 CHAPTER 3 SHELLS AS AN ASSEMBLY OF FLAT ELEMENTS		 103
3.1	Introduction	103
3.2	Stiffness of a plane element in local coordinates	105
3.3	Transformation to global coordinates and assembly of the elements	108
3.4	Local direction cosines	110
3.5	'Drilling' rotational stiffness—6 degree of freedom assembly	114
3.6	Elements with mid-side slope connections only	120
3.7	Choice of element	121
3.8	Some practical examples	121
 CHAPTER 4 AXISYMMETRIC SHELLS		 135
4.1	Introduction	135
4.2	Element characteristics—axisymmetrical loads—straight elements	137
4.3	Examples and accuracy	140
4.4	Curved elements and their shape functions	140
4.5	Strain expressions and properties of curved elements	145
4.6	Additional nodeless variables	148
4.7	Independent slope-displacement interpolation with penalty functions (thick or thin shell formulations)	149
 CHAPTER 5 SHELLS AS A SPECIAL CASE OF THREE-DIMENSIONAL ANALYSIS—REISSNER-MINDLIN ASSUMPTIONS		 159
5.1	Introduction	159
5.2	Geometric definition of the element	161
5.3	Displacement field	164
5.4	Definition of strains and stresses	165
5.5	Element properties and necessary transformations	167
5.6	Some remarks on stress representation	169
5.7	Special case of axisymmetric, curved, thick shells	170
5.8	Special case of thick plates	174
5.9	Convergence	174

5.10	Some shell examples	175
5.11	Concluding remarks	181
CHAPTER 6	SEMI-ANALYTICAL FINITE ELEMENT PROCESSES— USE OF ORTHOGONAL FUNCTIONS AND 'FINITE STRIP' METHODS	185
6.1	Introduction	185
6.2	Prismatic bar	188
6.3	Thin membrane box structures	192
6.4	Plates and boxes with flexure	193
6.5	Axisymmetric solids with non-symmetrical load	195
6.6	Axisymmetric shells with non-symmetric loading	199
6.7	Finite strip method—incomplete decoupling	202
6.8	Concluding remarks	206
CHAPTER 7	NON-LINEAR PROBLEMS—PLASTICITY, CREEP (VISCOPLASTICITY), NON-LINEAR FIELD PROBLEMS, ETC.	211
7.1	Introduction	211
7.2	Iterative techniques	214
7.3	Acceleration of convergence and line search procedures	220
7.4	'Softening' behaviour and displacement control	221
7.5	Convergence criteria	223
7.6	General remarks—incremental methods	224
7.7	General remarks—non-linear elasticity	225
7.8	Plasticity	228
7.9	Computation of stress increments	239
7.10	Some examples of plastic computation	244
7.11	The basic formulation of creep problems	250
7.12	Viscoplasticity	253
7.13	Viscoplasticity—history dependence of creep	260
7.14	Some special problems of rock, concrete, etc.	262
7.15	Non-uniqueness and localization in solid mechanics— some outstanding problems	266
7.16	Non-linear quasi-harmonic field problems	271
CHAPTER 8	GEOMETRICALLY NON-LINEAR PROBLEMS— LARGE DISPLACEMENT AND STRUCTURAL INSTABILITY	284
8.1	Introduction	284
8.2	General considerations	285
8.3	Large deflection and 'initial' stability of plates	290
8.4	Shells	299
8.5	General, large strain and displacement formulation	300
8.6	Concluding remarks	304

CHAPTER 9	THE TIME DIMENSION—SEMI-DISCRETIZATION OF FIELD AND DYNAMIC PROBLEMS AND ANALYTICAL SOLUTION PROCEDURES	312
9.1	Introduction	312
9.2	Direct formulation of time-dependent problems with spatial finite element subdivision	313
9.3	General classification	323
9.4	Free response—eigenvalues for second-order problems and dynamic vibrations	324
9.5	Free response—eigenvalues for first-order problems and heat conduction, etc.	334
9.6	Free response—damped dynamic eigenvalues	335
9.7	Forced periodic response	336
9.8	Transient response by analytical procedures	337
9.9	Symmetry and repeatability	341
CHAPTER 10	THE TIME DIMENSION—DISCRETE APPROXIMATION IN TIME	346
10.1	Introduction	346
10.2	Simple time-step algorithms for the first-order equation	348
10.3	General single-step algorithms for first- and second-order equations	362
10.4	Multistep recurrence algorithms	378
10.5	Some remarks on general performance of numerical algorithms	385
10.6	Non-linear problems	388
10.7	Concluding remarks	400
CHAPTER 11	COUPLED SYSTEMS	404
11.1	Coupled problems—definition and classification	404
11.2	Fluid–structure interaction (class I problem)	407
11.3	Soil–pore fluid interaction (class II problem)	420
11.4	Partitioned single-phase systems—implicit–explicit partitions (class I problems)	425
11.5	Staggered solution processes	429
CHAPTER 12	CONVECTION DOMINATED PROBLEMS	438
12.1	Introduction	438
12.2	The steady-state problem in one dimension—some preliminaries and Petrov–Galerkin methods	440
12.3	The steady-state problem in one dimension—balancing diffusion	448

12.4	The steady-state problem in one dimension—a variational principle	448
12.5	Least square–Galerkin approximation	451
12.6	Higher-order approximations	453
12.7	Extension to two (or three) dimensions	453
12.8	Steady state—concluding remarks	456
12.9	Transients—introductory remarks	459
12.10	Transient formulation of the variational and Petrov–Galerkin procedures	461
12.11	Least squares and space–time Petrov–Galerkin methods	467
12.12	Characteristic-based methods	471
12.13	Approximations of a higher time order and generalization to vector variables	484
12.14	Non-linear waves and shocks	494
12.15	Summary and concluding remarks	499
CHAPTER 13 FLUID MECHANICS—GOVERNING EQUATIONS AND INCOMPRESSIBLE FLOW; NEWTONIAN AND NON-NEWTONIAN VISCOUS FLOWS		506
13.1	Introduction	506
13.2	The governing equations of fluid mechanics	507
13.3	Governing equations	513
13.4	Inviscid, incompressible flow—potential formulation	514
13.5	Slow (creeping) fully incompressible viscous flow—the Stokes problem	518
13.6	Slow non-newtonian flows—metal and polymer forming	522
13.7	The Navier–Stokes problem and convective acceleration effects—steady-state solutions	534
13.8	The Navier–Stokes problem—transient solution procedures	542
13.9	Concluding remarks	550
CHAPTER 14 COMPRESSIBLE HIGH-SPEED GAS FLOW		557
14.1	Introduction	557
14.2	The governing equations	558
14.3	Boundary conditions—subsonic and supersonic flow	560
14.4	Numerical approximation and solution algorithms	562
14.5	Shock formation and artificial diffusion	564
14.6	Some preliminary examples for the Euler equation	565
14.7	Adaptive refinement and ‘shock capture’ in the Euler problem	568
14.8	The Navier–Stokes problem—boundary layer refinement	584

14.9	Some examples of viscous compressible flow computation	589
14.10	Compressible and incompressible behaviour	589
14.11	Concluding remarks	597
CHAPTER 15 SHALLOW WATER EQUATIONS AND WAVES		602
15.1	Introduction	602
15.2	The basis of shallow water equations	603
15.3	Numerical approximation	608
15.4	Examples of application	609
15.5	Drying areas	620
15.6	Shallow water transport	620
15.7	Introduction and equations	622
15.8	Waves in closed basins—finite element models	624
15.9	Waves in unbounded domains (exterior surface wave problems)	626
15.10	Boundary dampers	630
15.11	Linking to exterior solutions	630
15.12	Infinite elements	635
15.13	Three-dimensional effects	642
15.14	Large-amplitude waves	643
CHAPTER 16 COMPUTER PROCEDURES FOR FINITE ELEMENT ANALYSIS		651
16.1	Introduction	651
16.2	User instructions—description of additional program features	653
16.3	Example problem descriptions	654
16.4	Solution of non-linear problems	661
16.5	Restart option	665
16.6	Solution of transient linear and non-linear problems	665
16.7	Eigensolutions	673
16.8	Description of elements	677
16.9	Solution of example problems	683
16.10	Installation information and listings for program modules	695
