

Thermal Field Theory

MICHEL LE BELLAC

CAMBRIDGE MONOGRAPHS
ON MATHEMATICAL PHYSICS

Contents

<i>Preface</i>	xi
1 Introduction	1
1.1 Quantum chromodynamics	1
1.2 The deconfinement/chiral transition	4
1 The bag model	4
2 Lattice quantum chromodynamics	7
1.3 Heavy ion collisions	11
<i>References and further reading</i>	16
<i>Exercises</i>	17
2 Quantum statistical mechanics	18
2.1 Path integral formalism and imaginary time	19
2.2 Operator formalism	24
2.3 The spectral function $\rho(k_0)$	25
2.4 The Matsubara (or imaginary-time) propagator	27
2.5 The time-ordered propagator	28
2.6 Frequency sums	29
<i>References and further reading</i>	32
<i>Exercises</i>	32
3 The scalar field at finite temperature	35
3.1 The neutral scalar field	35
1 Wick's theorem and the propagator	36
2 First-order corrections: propagator and partition function	39
3 Feynman rules	43
3.2 The charged scalar field	44
3.3 Real-time formalism	47
1 Path integrals	47

2	Integration path and propagators	50
3	Feynman rules with the symmetric propagator	54
3.4	The self-energy in the real-time formalism	55
3.5	Renormalization at non-zero temperature	58
	<i>References and further reading</i>	60
	<i>Exercises</i>	60
4	Simple applications of perturbation theory	62
4.1	Ring diagrams in the ϕ^4 -model	62
4.2	Some one-loop diagrams	65
	1 Self-energy diagram in the imaginary-time formalism	66
	2 Self-energy diagram in the real-time formalism	69
	3 The three-point vertex at one-loop	70
4.3	Cutting rules at finite temperature	72
	1 Derivation of the rules	72
	2 Application to the self-energy	75
4.4	Physical interpretation of discontinuities	77
	1 Production of a weakly interacting massive particle	77
	2 Production of a weakly interacting massless particle	78
	3 General proof	81
	4 Small deviations from equilibrium	83
	<i>References and further reading</i>	85
	<i>Exercises</i>	85
5	Dirac and gauge fields at finite temperature	86
5.1	The Dirac field at finite temperature	86
	1 Coherent fermion states and path integrals	86
	2 Quantization of the Dirac field	90
	3 Frequency sums	93
	4 Non-zero chemical potential	95
5.2	Quantization of gauge fields at non-zero temperature	97
	1 The partition function	98
	2 The gauge boson propagator in linear gauges	102
	3 The gauge boson propagator at non-zero temperature	106
5.3	Real photon and lepton pair production	108
	1 Real photon production	109
	2 Lepton pair production	109
	<i>References and further reading</i>	111
	<i>Exercises</i>	111
6	Collective excitations in a plasma	114
6.1	Linear response theory	115
6.2	The photon propagator in a QED plasma	118

1	General form of the photon propagator	118
2	The hard thermal loop approximation for $\Pi_{\mu\nu}$	119
3	Evaluation of $\Pi_{\mu\nu}$	121
4	Transverse and longitudinal photons	123
6.3	Debye screening and plasma oscillations	124
1	Linear response and Debye screening	124
2	Plasma oscillations	127
3	Sum rules and residues	129
4	Non-zero chemical potential	133
6.4	Kinetic derivation of the photon self-energy	134
6.5	The electron propagator in a QED plasma	138
1	Evaluation of Σ	138
2	Quasi-particles	140
6.6	Elementary excitations in a QCD plasma	144
	<i>References and further reading</i>	147
	<i>Exercises</i>	147
7	Hard thermal loops and resummation	150
7.1	Hard thermal loops in QED	150
1	The three-point function in QED	150
2	The four-point functions in QED	154
3	The effective Lagrangian in QED	156
7.2	The QCD plasma	158
1	The three-point functions in QCD	158
2	General remarks on hard thermal loops	161
3	Hard thermal loops from Ward identities	163
7.3	The effective expansion	168
1	General theory	168
2	Production of soft dileptons in a quark–gluon plasma	172
3	The gluon damping rate	175
4	Higher-order calculations	178
7.4	Kinetic theory of hard thermal loops	180
	<i>References and further reading</i>	188
	<i>Exercises</i>	188
8	Dynamical screening	191
8.1	Energy loss of a heavy fermion in a QED plasma	192
8.2	Production of hard real photons from a quark–gluon plasma	199
8.3	Screening and transport phenomena	202
	<i>References and further reading</i>	210
	<i>Exercises</i>	210

9 Neutrino emission from stars	212
9.1 The photon dispersion relations revisited	213
9.2 Neutrino emission from photon decay	217
<i>References and further reading</i>	221
<i>Exercises</i>	221
10 Infrared problems at finite temperature	222
10.1 Kinoshita–Lee–Nauenberg theorem in lepton pair production	223
1 The two-loop approximation	225
2 Resummation and infrared safe processes	227
10.2 Transverse gluons in the static limit	229
1 The magnetic mass	229
2 Linde’s problem	231
10.3 Soft photon production	232
10.4 Fermion damping rate	235
<i>References and further reading</i>	237
<i>Exercises</i>	238
A Formulary	239
B Operator formalism	244
<i>References</i>	249
<i>Index</i>	254

CAMBRIDGE MONOGRAPHS ON MATHEMATICAL PHYSICS

Edited by

P.V. LANDSHOFF

Professor of Mathematical Physics, University of Cambridge

D.R. NELSON

Professor of Physics, Harvard University

D.W. SCIAMA

*International School for Advanced Studies, Trieste, and
Churchill College, Cambridge*

S. WEINBERG

*Josey Regental Professor of Science,
University of Texas at Austin*

This highly acclaimed series of monographs provides introductory accounts of specialized topics in mathematical physics for graduate students and research workers. The monographs in this series are of outstanding scholarship and written by those at the very frontiers of research. Subject areas covered include cosmology, astrophysics, relativity theory, particle physics, quantum theory, nuclear physics, statistical mechanics, condensed matter physics, plasma physics and the theory of chaos.

The series includes:

The large scale structure of space-time

S.W. Hawking and G.F.R. Ellis

'The book is a masterpiece written by sure hands . . . students could not ask for better navigators through space-time than Hawking and Ellis.'

Science

Spinors and space-time.

Volume 1. Two-spinor calculus and relativistic fields.

Volume 2. Spinor and twistor methods in space-time geometry

R. Penrose and W. Rindler

'The organization of the book is excellent . . . there is no doubt that the material in these two volumes will continue to be studied for many years and will lead to results in differential geometry, general relativity and other parts of Physics.

Physics Today

Superstring Theory.

Volume 1. Introduction.

Volume 2. Loop amplitudes, anomalies and phenomenology

M.B. Green, J. H. Schwarz and E. Witten

Anyone wishing to become more familiar with superstring theories will wish to read these two excellent books. Volume 1 provides a self-contained introduction to the theory. Volume 2 goes on to discuss more advanced topics.

'The publication of this new two-volume text has . . . been eagerly awaited . . . both volumes of Superstring Theory are likely to remain standard works for years to come; certainly, there is no serious rival at present.'

Nature

All above books are issued as paperbacks. A full series list appears on page iv of the text.
