Data Analysis for Database Design

Third edition

David Howe

Formerly Professor of Information Systems
De Montfort University

BUTTERWORTH HEINEMANN

OXFORD AUCKLAND BOSTON JOHANNESBURG MELBOURNE NEW DELHI

Contents

Preface to the Third Edition ix
Readership — Scope — Structure and content — Terminology — Questions and assignments — Comparison with the second edition — Acknowledgements

Part A: Introduction 1

Database — Torg Ltd — Analysis — Answer pointers

Part 1: Databases and database management systems 13

1 Database systems 15
The database approach — Program/data independence — Other database management system facilities — What constitutes a database management system? — Disadvantages — Database vs database management system — Scope of a database — Assignment — Answer pointers

2 Database management system architecture 24
Introduction — A three-level architecture — The conceptual schema — The external schema — The internal schema — Mapping — DBMS components — Advantages of three-level architecture — Data administration — Model vs schema — Terminology — Assignments — Answer pointers

Part 2: Relational modelling 33

3 Tables 35
Introduction — Tables — Nulls — Normalisation — Answer pointers

4 Redundant vs duplicated data 39
Introduction — Redundant vs duplicated data — Elimination of redundancy — Deceptive appearances — Enterprise rules — Answer pointers

5 Repeating groups 47
Introduction — Repeating groups — Elimination of repeating groups (normalisation) — Assignments — Separate attribute types — Answer pointers

6 Determinants and identifiers 57
Introduction — Determinants — Superfluous attributes — Determinancy

diagrams—Composite determinants—Transitive determinants—Terminology—Assignment—Identifiers—Determinancy diagrams and redundancy—Transformation into well-normalised tables—Notation—Assignment—Answer pointers

7 Fully-normalised tables 80
Introduction—Hidden transitive dependency—Multi-valued determinancy—Advantages of full normalisation—Normal forms—Assignments—Answer pointers

Part 3: Entity-relationship modelling 89

8 Introduction to entity-relationship modelling 91
Bottom-up data modelling—Entity-relationship modelling—Type vs occurrence—Identifiers—Entity-relationship diagrams—Answer pointers

9 Properties of relationships 98
The degree of a relationship—Determinancy constraints—Participation conditions—Multiplicity—Choice of notation—Answer pointers

10 Decomposition of many:many relationships 109
Decomposition—Answer pointers

11 Connection traps 116
Introduction—Misinterpretation—Fan traps—Chasm traps—Further fan traps—Decomposition of complex relationships—Summary—Answer pointers

12 Skeleton entity-relationship models 129
Introduction—Representation of 1:1 relationships—Representation of 1:many relationships—Representation of many:many relationships—Pre-posted identifiers—Skeleton tables—Relationship identifiers—Relationship vs row identifiers—Review—Recursive relationships—Answer pointers

13 Attribute assignment 147
Assignment rules—1:1 relationships—1:many relationships—Many:many relationships—Extending the skeleton model—Superfluous entity tables—Entity subtypes—Answer pointers

14 First-level design 159
Introduction—First-level design procedure—First-level design example—Answer pointers

15 Second-level design 171
Introduction—Flexing by table elimination—Flexing by splitting—Derivable attributes—Assignment—Second-level design example—Answer pointers

Part 4: Further topics 187

16 Distributed database systems 189
Introduction – An extended library scenario – A distributed database design – Distributed data independence – Avoiding complications – Answer pointers

17 Relational algebra 197
Table-at-a-time processing – Relational algebra operations – Sample queries – Further join operations – Union, intersection and difference – Division – Extended Cartesian product – Update – Nested operations – Assignment – Answer pointers

18 Query optimisation 213
Query processing – Query plans – Storage structures – Optimisation – Distributed database optimisation – Summary – Answer pointers

19 The SQL language 228
Introduction – Table creation – Retrieving data – Updating data – Views – Drop – Alter – Granting and revoking privileges – Embedded SQL – Some SQL issues – Answer pointers

20 Object-orientation 261
Introduction – Overview of object-orientation – Class diagrams – Object-oriented developments – Further data types – SQL99 inheritance – User defined types – Answer pointers

Appendix A: The Codasyl (network) model 275
Acknowledgements to Codasyl – A1: Basics of the Codasyl (network) model – A2: Further Codasyl schema facilities – A3: Further Codasyl DML facilities

Bibliography 317
