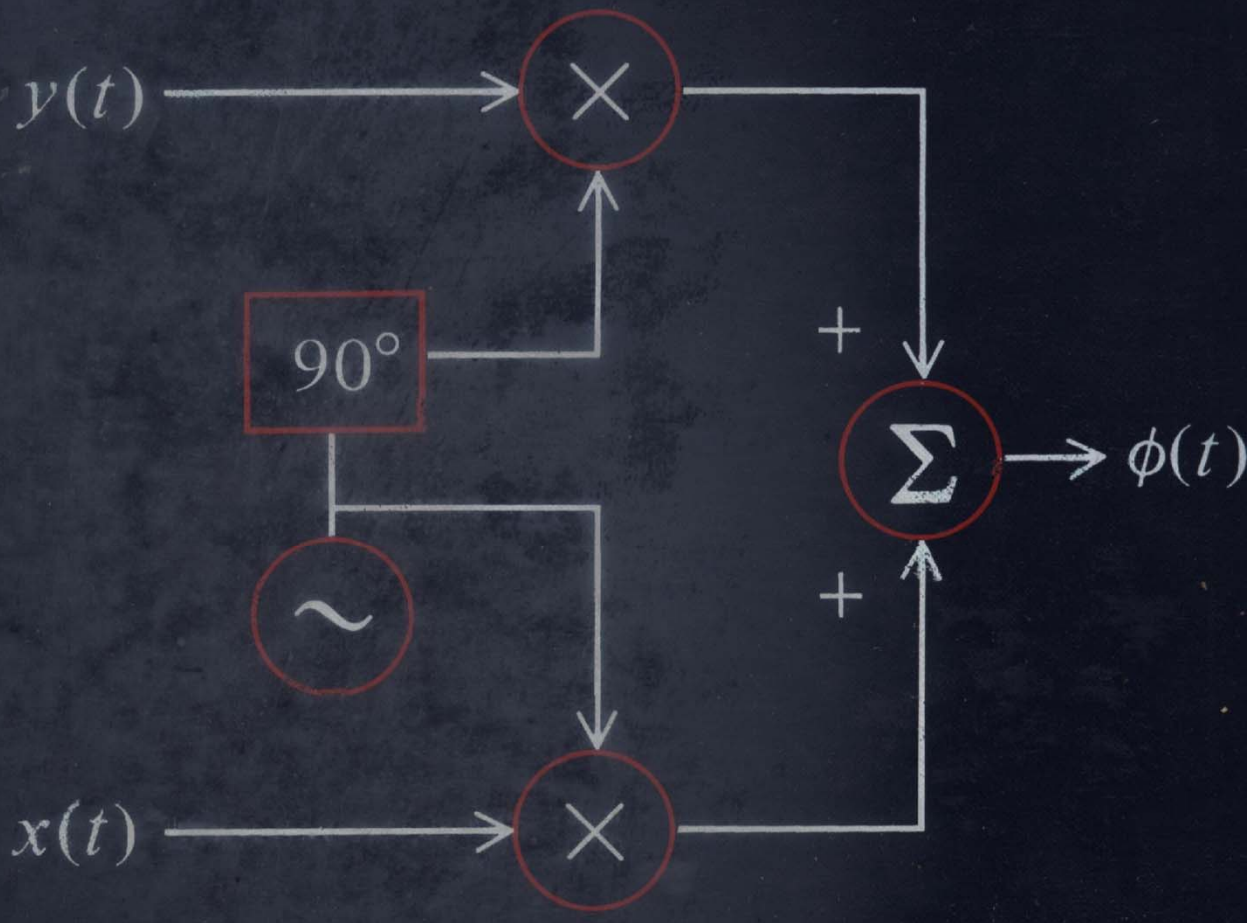
INTRODUCTION TO COMMUNICATION SYSTEMS

SECOND EDITION

Ferrel G. Stremler



CONTENTS

Chapter 1	**Introduction**	1
Chapter 2	**Orthogonality and Signal Representations**	
2.1	Signals and systems	9
2.2	Classification of signals	11
2.3	Classification of systems	13
★2.4	Signals and vectors	15
★2.5	Orthogonal functions	17
★2.6	Choice of a set of orthogonal functions	23
2.7	The exponential Fourier series	25
2.8	Complex signals and representations	27
2.9	The trigonometric Fourier series representation	31
2.10	Extension by periodicity	34
2.11	Parseval's theorem for power signals	36
2.12	The frequency transfer function	38
2.13	Steady-state response to periodic signals	40
2.14	Harmonic generation	42
2.15	The Fourier spectrum and examples	44
★2.16	Numerical computation of Fourier coefficients	50
★2.17	Effects of alias terms	53
2.18	Singularity functions	59
2.19	Impulse response	64
★2.20	Convergence of the Fourier series	66
2.21	Summary	68
	Problems	70
Chapter 3	**The Fourier Transform and Applications**	
3.1	Representation of an aperiodic function over the entire real line	79
3.2	The spectral density function	82
★3.3	Existence of the Fourier transform	84
3.4	Parseval's theorem for energy signals	85

3.5	Some Fourier transforms involving impulse functions	85
3.6	Properties of the Fourier transform	92
3.7	Some convolution relationships	105
3.8	Graphical interpretation of convolution	107
3.9	Filter characteristics of linear systems	109
3.10	Transversal filters	111
3.11	Bandwidth of a system	114
3.12	Requirements for distortionless transmission	114
3.13	Time response of filters	115
★3.14	Minimum time-bandwidth product	119
3.15	The sampling theorem	122
★3.16	Aliasing effects in sampling	126
★3.17	The discrete Fourier transform	129
★3.18	The fast Fourier transform	136
3.19	Summary	140
	Problems	141

Chapter 4	**Power Spectral Density**	
4.1	Energy spectral density	151
4.2	Power spectral density	156
4.3	Time-averaged noise representations	164
4.4	Correlation functions	167
4.5	Some properties of correlation functions	172
4.6	Correlation functions for finite-energy signals	176
4.7	Band-limited white noise	177
4.8	Summary	193
	Problems	195

Chapter 5	**Amplitude Modulation**	201
5.1	Amplitude modulation: suppressed carrier	202
5.2	Amplitude modulation: large carrier (AM)	222
5.3	Frequency-division multiplexing (FDM)	233
5.4	Single-sideband (SSB) modulation	240
5.5	Vestigial-sideband modulation	251
5.6	A time-representation of bandpass noise	254
5.7	Effects of noise in AM systems	257
5.8	Propagation effects	262
5.9	Comparison of various AM systems	265
5.10	Summary	266
	Problems	268

Chapter 6	**Angle Modulation**	
6.1	FM and PM	279
6.2	Narrowband FM	282
6.3	Wideband FM	286
6.4	Average power in angle-modulated waveforms	300

6.5	Phase modulation	302
6.6	Generation of wideband FM signals	304
6.7	Demodulation of FM signals	310
6.8	Signal-to-noise ratios in FM reception	326
6.9	Threshold effect in FM	333
6.10	Signal-to-noise improvement using deemphasis	337
6.11	Summary	341
	Problems	343
Chapter 7	**Pulse Modulation**	351
7.1	Pulse-amplitude modulation (PAM)	352
7.2	Time-division multiplexing (TDM)	357
7.3	Pulse shaping and intersymbol interference	367
7.4	Other types of analog pulse modulation: PWM & PPM	370
7.5	Signal-to-noise ratios in analog pulse modulation	378
7.6	Pulse-code modulation (PCM)	382
7.7	Use of parity and redundancy in PCM	393
7.8	Time-division multiplexing of PCM signals	395
7.9	The matched filter	406
7.10	Matched-filter code word detection	412
7.11	Pseudonoise (PN) sequences	415
7.12	Summary	419
	Problems	421
Chapter 8	**Probability and Random Variables**	431
8.1	Probability	434
8.2	Conditional probability and statistical independence	437
8.3	The random variable and cumulative distribution function	440
8.4	The probability density function	444
8.5	Statistical averages	450
8.6	Some probability distributions	458
★8.7	The histogram	460
★8.8	Transformations of random variables	463
8.9	Joint and conditional density functions	466
★8.10	Correlation between random variables	470
★8.11	The bivariate gaussian distribution	471
8.12	Random processes	477
8.13	Autocorrelation and power spectra	488
★8.14	Numerical computation of power spectra	490
8.15	Summary	492
	Problems	
Chapter 9	**Information and Digital Transmission**	499
9.1	A measure of information	504
9.2	Channel capacity	508
9.3	Ideal demodulator detection gain	

9.4	Quantization noise	509
9.5	Probability of error in transmission	515
9.6	*S/N* performance of PCM	524
9.7	Delta modulation and DPCM	526
★9.8	Error analysis of PCM repeaters	531
★9.9	Power spectral densities of PCM signals	534
9.10	Partial-response signaling	539
9.11	Equalization	544
9.12	*M*-ary signaling	551
★9.13	Coding for reliable communication	557
9.14	Summary	562
	Problems	564

Chapter 10 Digital Modulation

10.1	Amplitude-shift keying (ASK)	571
10.2	Frequency-shift keying (FSK)	574
10.3	Phase-shift keying (PSK)	580
10.4	Comparison of binary digital modulation systems	588
10.5	Quadrature AM (QAM) and quaternary PSK (QPSK)	590
10.6	Continuous-phase FSK (CPFSK) and minimum-shift keying (MSK)	596
★10.7	*M*-ary orthogonal FSK	604
10.8	*M*-ary PSK	607
10.9	Amplitude-phase keying (APK)	611
10.10	Comparison of digital modulation systems	615
★10.11	Representation of digital waveforms	616
★10.12	Optimum detection algorithms	620
10.13	Summary	626
	Problems	628

Appendixes

A	Selected mathematical tables	637
B	Decibels	641
C	Broadcast frequency bands	643
D	Commercial television transmissions	651
E	Facsimile transmissions	667
F	Some commercial preemphasis/deemphasis systems	671
G	The complementary error function	675
H	Stereo AM	679
I	A table of Bessel functions	689

Index 691

Rear endpapers

Left: Selected Fourier transform pairs

Right: Fourier transforms corresponding to given mathematical operations
