between the stage of the macular hole and the degree of posterior vitreous detachment.

- **356 Reproducibility and clinical application of a newly developed stabilized retinal laser Doppler instrument.** Akitoshi Yoshida, MD, PhD, Gilbert T. Feke, PhD, Fumihiko Mori, MD, PhD, Taiji Nagaoka, MD, PhD, Naoki Fujio, MD, PhD, Hironobu Ogasawara, MD, PhD, Suguru Konno, MD, PhD, and J. Wallace McMeel, MD

A new retinal laser Doppler instrument that measures blood flow in actual units of  $\mu\text{l}/\text{min}$  can be used in a clinical setting for reliable evaluation of retinal hemodynamics.

- **362 Adult-onset foveomacular vitelliform dystrophy: a study by optical coherence tomography.** Nathanael Benhamou, MD, Eric H. Souied, MD, PhD, Ricky Zolf, MD, Florence Coscas, MD, Gabriel Coscas, MD, and Gisele Soubrane, MD, PhD

This study evaluates the morphology of adult-onset foveomacular vitelliform dystrophy using optical coherence tomography. Optical coherence tomography demonstrates, better than biomicroscopy, the location of the yellowish material, between the photoreceptor and the retinal pigment epithelium layers.

- **368 A family with Axenfeld-Rieger syndrome and Peters anomaly caused by a point mutation (Phe112Ser) in the FOXC1 gene.** Robert A. Honkanen, MD, Darryl Y. Nishimura, P, Ruth E. Swiderski, PhD, Steven R. Bennett, MD, Sungpyo Hong, MD, Young H. Kwon, MD, PhD, Edwin M. Stone, MD, PhD, Val C. Sheffield, MD, PhD, and Wallace L.M. Alward, MD

A single Phe112Ser point mutation in the FOXC1 gene was found to cause a spectrum of ocular and systemic abnormalities including Axenfeld-Rieger syndrome, Peters anomaly, and possibly cardiac disease.
