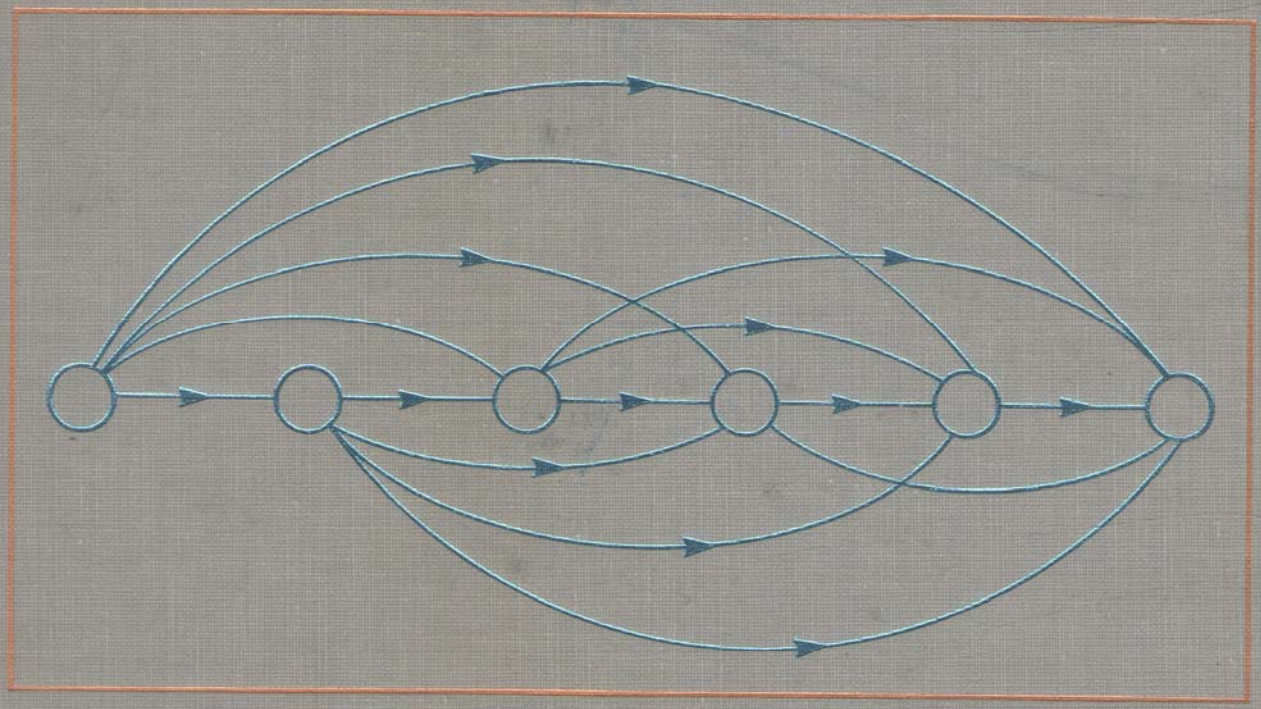
OPERATIONS RESEARCH

PRINCIPLES AND PRACTICE



SECOND EDITION

RAVINDRAN
PHILLIPS
SOLBERG

CONTENTS

CHAPTER 1 THE NATURE OF OPERATIONS RESEARCH 1

1.1 The History of Operations Research 1
1.2 The Meaning of Operations Research 3
1.3 Models in Operations Research 4
1.4 Principles of Modeling 7

CHAPTER 2 LINEAR PROGRAMMING 13

2.1 Introduction 13
2.2 Formulation of Linear Programming Models 14
2.3 Graphical Solution of Linear Programs in Two Variables 23
2.4 Linear Program in Standard Form 27
2.5 Solving Systems of Linear Equations 30
2.6 Principles of the Simplex Method 33
2.7 Simplex Method in Tableau Form 36
2.8 Computational Problems 43
2.9 Finding a Feasible Basis 46
2.10 Computer Solution of Linear Programs 53
2.11 Sensitivity Analysis in Linear Programming 55
2.12 Applications 58
2.13 Additional Topics in Linear Programming 59
Recommended Readings 60
References 60
Exercises 61

CHAPTER 3 NETWORK ANALYSIS 73

3.1 Some Examples of Network Flow Problems 73
3.2 Transportation Problems 73
3.3 Assignment Problems 88
3.4 Maximal-Flow Problems 92
3.5 Shortest-Route Problems 102
3.6 Minimal Spanning Tree Problems 107

3.7 Project Management 109
Recommended Readings 126
References 126
Exercises 127

CHAPTER 4 ADVANCED TOPICS IN LINEAR PROGRAMMING 135

4.1 The Revised Simplex Method 135
4.2 Duality Theory and Its Applications 149
4.3 The Dual Simplex Method 163
4.4 Sensitivity Analysis in Linear Programming 169
4.5 Parametric Programming 179
4.6 Integer Programming 184
4.7 Goal Programming 198
Recommended Readings 207
References 207
Exercises 209

CHAPTER 5 DECISION ANALYSIS 221

5.1 Introduction 221
5.2 Characteristics of a Decision Problem 223
5.3 Terminal Decisions Based on Prior Information 224
5.4 Expected Value of Perfect Information (EVPI) 229
5.5 Decision Trees 232
5.6 Sequential Decisions 234
5.7 Information Acquisition Decisions 239
Summary 245
References 245
Exercises 246

CHAPTER 6 RANDOM PROCESSES 251

6.1 Introduction 251

I DISCRETE TIME PROCESSES 252

6.2 An Example 252
6.3 Modeling the Process 252
6.4 A Numerical Example 260
6.5 The Assumptions Reconsidered 261
6.6 Formal Definitions and Theory 262
6.7 First-Passage and First-Return Probabilities 264
6.8 Classification Terminology 265
6.9 Ergodic Markov Chains 268
6.10 Absorbing Markov Chains 272

II CONTINUOUS TIME PROCESSES 278
6.11 An Example 278
6.12 Formal Definitions and Theory 282
6.13 The Assumptions Reconsidered 286
6.14 Steady-State Probabilities 287
6.15 Birth-Death Processes 290
6.16 The Poisson Process 291
6.17 Conclusions 296
Recommended Readings 296
References 297
Exercises 297

CHAPTER 7 QUEUEING MODELS 305
7.1 Introduction 305
7.2 An Example 305
7.3 General Characteristics 309
7.4 Performance Measures 312
7.5 Relations Among the Performance Measures 314
7.6 Markovian Queueing Models 315
7.7 The M/M/1 Model 318
7.8 Limited Queue Capacity 322
7.9 Multiple Servers 325
7.10 An Example 327
7.11 Finite Sources 329
7.12 Queue Disciplines 331
7.13 Non-Markovian Queues 332
7.14 Networks of Queues 335
7.15 Conclusions 336
Recommended Readings 337
References 337
Exercises 337

CHAPTER 8 INVENTORY MODELS 343
8.1 Introduction 343

I DETERMINISTIC MODELS 344
8.2 The Classical Economic Order Quantity 345
8.3 A Numerical Example 348
8.4 Sensitivity Analysis 348
8.5 Nonzero Lead Time 349
8.6 The EOQ with Shortages Allowed 350
8.7 The Production Lot-Size Model 351
8.8 Other Deterministic Inventory Models 351

II PROBABILISTIC MODELS 352
8.9 The Newsboy Problem: A Single Period Model 353
8.10 A Lot Size, Reorder Point Model 356

8.11 Some Numerical Examples 364
8.12 Variable Lead Times 367
8.13 The Importance of Selecting the Right Model 369
8.14 Conclusions 370
Recommended Readings 370
References 370
Exercises 371

CHAPTER 9 SIMULATION 375

I BASIC CONCEPTS 375
9.1 Introduction 375
9.2 The Philosophy, Development and Implementation of Simulation Modeling 377
9.3 Design of Simulation Models 381

II EXAMPLES OF SIMULATION MODELING 383
9.4 Performance of a Baseball Hitter 383
9.5 Simulation of a Tool Crib 385
9.6 Production Line Maintenance 388

III PSEUDO-RANDOM NUMBERS 397
9.7 The Uniform Distribution and Its Importance to Simulation 397
9.8 Generation of Random Numbers 398
9.9 The Logic in Generating Uniform Random Variates via a Congruential Method 399
9.10 Testing a Uniform Random-Number Generator 400

IV TECHNIQUES FOR GENERATING RANDOM DEVIATES 401
9.11 The Inverse Transformation Method 401
9.12 The Rejection Technique 404
9.13 The Composition Method 408
9.14 Mathematical Derivation Technique 411
The Box and Muller Technique for Generating Normal Deviates 412
9.15 Approximation Techniques 412
9.16 Special Probability Distributions 414

V SIMULATION LANGUAGES 416
9.17 An Overview 416
9.18 Comparison of Selected Existing Simulation Languages 418
GPSS (General Purpose Systems Simulator) 418
SIMSCRIPT 2.5 419
MAP/1 419
SIMULA 420
DYNAMO 421
SLAM II 421
SIMAN 422
9.19 The Microcomputer Revolution in Simulation Applications 423

VI ADVANCED CONCEPTS IN SIMULATION ANALYSIS 425
9.20 Design of Simulation Experiments 426
9.21 Variance Reduction Techniques 426
9.22 Statistical Analysis of Simulation Output 427
9.23 Optimization of Simulation Parameters 428
9.24 Summary and Conclusions 428
Selected Reference Texts 429
References 429
Exercises 432

CHAPTER 10 DYNAMIC PROGRAMMING 437

I BASIC CONCEPTS 437
10.1 Introduction 437
10.2 Historical Background 437

II THE DEVELOPMENT OF DYNAMIC PROGRAMMING 438
10.3 Mathematical Description 438
10.4 Developing an Optimal Decision Policy 441
10.5 Dynamic Programming in Perspective 443

III ILLUSTRATIVE EXAMPLES 443
10.6 A Problem in Oil Transport Technology 443
10.7 A Facilities Selection Problem 451
10.8 The Optimal Cutting Stock Problem 456
10.9 A Problem in Inventory Control 463

IV CONTINUOUS STATE DYNAMIC PROGRAMMING 467
10.10 Introduction 467
10.11 A Nonlinear Programming Problem 467
10.12 A Problem in Mutual Fund Investment Strategies 469

V MULTIPLE STATE VARIABLES 472
10.13 The "Curse of Dimensionality" 472
10.14 A Nonlinear, Integer Programming Problem 472
10.15 Elimination of State Variables 477

VI STOCHASTIC SYSTEMS 477
10.16 Stochastic Dynamic Programming—A Brief Overview 477
10.17 Summary and Conclusions 479
References 479
Exercises 481

CHAPTER 11 NONLINEAR PROGRAMMING 487

I BASIC CONCEPTS 487
11.1 Introduction 487
11.2 Taylor's Series Expansions; Necessary and Sufficiency Conditions 494

II UNCONSTRAINED OPTIMIZATION 504
11.3 Fibonacci and Golden Section Search 504
11.4 The Hooke and Jeeves Search Algorithm 511
11.5 Gradient Projection 515

III CONSTRAINED OPTIMIZATION PROBLEMS: EQUALITY CONSTRAINTS 524
11.6 Lagrange Multipliers 524
11.7 Equality Constrained Optimization: Constrained Derivatives 530
11.8 Projected Gradient Methods with Equality Constraints 534

IV CONSTRAINED OPTIMIZATION PROBLEMS: INEQUALITY CONSTRAINTS 539
11.9 Nonlinear Optimization—The Kuhn-Tucker Conditions 539
11.10 Quadratic Programming 543
11.11 Complementary Pivot Algorithms 547
11.12 Separable Programming 556

V THE GENERAL NONLINEAR PROGRAMMING PROBLEM 563
11.13 Nonlinear Objective Function Subject to Linear or Nonlinear Constraints: A Cutting Plane Algorithm 563
11.14 Optimization by Geometric Programming 569
References 579
Exercises 580

587

APPENDICES

Appendix A Review of Linear Algebra 589
Appendix B Probability Review 597
Appendix C Random Number Generation 621

629
