
DYNAMIC ANALYSIS AND EARTHQUAKE RESISTANT DESIGN

VOLUME I

Strong Motion and Dynamic Properties

Japanese Society of Civil Engineers

Contents

Preface to Series	v
Preface to Volume 1	vii
Part I Strong Motion and Design Earthquake Motion	1
1 Basic Parameters of Earthquake Motion	3
1.1 Types and Characteristics of Seismic Waves	3
1.2 Size of Earthquake and Intensity of Seismic Motion	8
1.2.1 Parameters expressing size of earthquake and intensity of seismic motion	8
1.2.2 Types of magnitude	9
1.3 Seismic Motion and Fault Model	11
2 Strong Ground Motion	17
2.1 Strong-motion Observations	17
2.1.1 Strong-motion recording	17
2.1.2 Array observations	19
2.2 Characteristics of Strong-motion Records	23
2.2.1 Digitization of observed records	23
2.2.2 Maximum acceleration, maximum velocity, and maximum displacement	24
2.2.3 Duration and frequency characteristics	27
2.3 Strong Motion with Fault Model	29
2.3.1 Simulated strong motion using fault model	29
2.3.2 Prediction of strong seismic motion using fault model	32
3 Earthquake-hazard Analysis	34
3.1 Meaning of Earthquake-hazard Analysis	34
3.1.1 Definition of earthquake-hazard analysis	34
3.1.2 Risk index and evaluation of earthquake motion	35

3.2	Seismic Activity Model	36
3.2.1	Essential points for modeling and basic data	36
3.2.2	Classification of seismic zones	39
3.2.3	Calculation of probability of earthquake occurrence	40
3.2.4	Model of time-space distribution of earthquake occurrence	44
3.2.5	Models of relative frequency of earthquake magnitudes	45
3.3	Earthquake-hazard Analysis Pertaining to Intensity of Earthquake Motion	46
3.3.1	Analysis based on Poisson model	46
3.3.2	Method using data for given point directly	48
3.3.3	Expressing results of analysis	49
3.3.4	Problems involved in earthquake-hazard analysis	50
3.4	Application in Generating Earthquake Time History for Dynamic Analysis	53
3.4.1	Method using hazard curve for maximum ground motion	53
3.4.2	Method using uniform risk spectrum	53
3.4.3	Method in which all earthquake-motion parameters are determined from earthquake-hazard analysis (risk-compatible earthquake motion)	54
4	Design Earthquake Motion	57
4.1	Seismic Force According to Seismic-coefficient Method or Modified Seismic-coefficient Method	57
4.1.1	Seismic-coefficient method	57
4.1.2	Modified seismic-coefficient method	60
4.2	Response Spectrum	62
4.3	Design Spectrum	66
4.4	Combination of Seismic Forces	69
4.4.1	Ratio of maximum vertical and horizontal ground motion	69
4.4.2	Effect of combination of two horizontal components of strong-motion records	71
4.4.3	Correlation between response spectra	72
4.4.4	Concept of principal axis	72
4.5	Inelastic Response Spectrum	73
4.6	Limiting Condition and Design Seismic Force	76
4.7	Load Combination	77
4.8	Dynamic Analysis	79
	Literature Cited	83

Part II Dynamic Properties of Soil and Structural Materials	89
1 Physical Parameters Necessary for Structural Analysis	91
2 Dynamic Properties of Soil	92
2.1 Concept	92
2.2 Expressing Dynamic Deformation Properties of Soil	93
2.2.1 Linear representation	93
2.2.2 Nonlinear expression	96
2.3 Shear Modulus and Damping Ratio for Soil	100
2.3.1 Shear-elasticity modulus	100
2.3.2 Damping ratio	119
3 Dynamic Properties of Steel	128
3.1 Basic Deformation Properties of Steel	128
3.1.1 Stress-strain relation	128
3.1.2 Thin-walled material and thick-walled material	131
3.1.3 Effects of residual stress	131
3.1.4 Initial deflection and residual deflection	132
3.2 Strength and Deformation Properties of Steel Members	133
3.2.1 Tensile member	133
3.2.2 Thin-walled section column	133
3.2.3 Beam and beam-column member	136
4 Inelastic Properties of Concrete Subjected to Repetitive Loads	139
4.1 Concept	139
4.2 Constitutional Equation for Concrete Structures	140
4.2.1 Stress-strain relation under static loading	140
4.2.2 Stress-strain relation of concrete subjected to repetitive loading	142
4.3 Bending Deformation in Reinforced Concrete Member	144
4.3.1 Bending deformation properties of members	144
4.3.2 Hysteresis properties and their modeling	149
4.3.3 Modeling using equivalent linearization method	155
4.4 Shear Resistance of Reinforced Concrete Member	158
4.4.1 Beam without shear reinforcement	158
4.4.2 Beam with shear reinforcement	160

5 Test Methods for Dynamic Material Properties	161
5.1 Test Methods for Soil	161
5.1.1 Introduction	161
5.1.2 Laboratory tests	161
5.1.3 In-situ tests	167
5.2 Hybrid Tests	176
5.2.1 Considerations of hybrid tests	176
5.2.2 Hybrid test on a two-layer steel frame structure	176
5.2.3 Pseudodynamic test system at the Building Research Institute	177
5.2.4 Bending seismic-response test under varying axial force	177
5.2.5 Future of hybrid tests	179
Literature Cited	181
Index	187
