

# Dynamical Systems Approach to Turbulence

Tomas Bohr, Mogens H Jensen,  
Giovanni Paladin and Angelo Vulpiani

Cambridge Nonlinear Science Series 8

# Contents

To the memory of Giovanni    *xiii*

Preface    *xv*

Introduction    *xvii*

<b>Chapter 1</b>	<b>Turbulence and dynamical systems</b>	<b>1</b>
1.1	What do we mean by turbulence?	1
1.2	Examples of turbulent phenomena	3
1.2.1	<i>Fluids</i>	3
1.2.2	<i>Chemical turbulence</i>	7
1.2.3	<i>Flame fronts</i>	9
1.3	Why a dynamical system approach?	11
1.4	Examples of dynamical systems for turbulence	11
1.4.1	<i>Shell models</i>	11
1.4.2	<i>Coupled map lattices</i>	12
1.4.3	<i>Cellular automata</i>	13
1.5	Characterization of chaos in high dimensionality	14
1.5.1	<i>Lyapunov exponents in extended systems</i>	14
1.5.2	<i>Lyapunov spectra and dimension densities</i>	15
1.5.3	<i>Characterization of chaos in discrete models</i>	18
1.5.4	<i>The correlation length</i>	18
1.5.5	<i>Scaling invariance and chaos</i>	19

<b>Chapter 2</b>	<b>Phenomenology of hydrodynamic turbulence</b>	<b>21</b>
2.1	Turbulence as a statistical theory	21
2.1.1	<i>Statistical mechanics of a perfect fluid</i>	22
2.1.2	<i>Basic facts and ideas on fully developed turbulence</i>	24
2.1.3	<i>The closure problem</i>	28
2.2	Scaling invariance in turbulence	31
2.3	Multifractal description of fully developed turbulence	34
2.3.1	<i>Scaling of the structure functions</i>	34
2.3.2	<i>Multiplicative models for intermittency</i>	36
2.3.3	<i>Probability distribution function of the velocity gradients</i>	40
2.3.4	<i>Multiscaling</i>	43
2.3.5	<i>Number of degrees of freedom of turbulence</i>	44
2.4	Two-dimensional turbulence	45
<b>Chapter 3</b>	<b>Reduced models for hydrodynamic turbulence</b>	<b>48</b>
3.1	Dynamical systems as models of the energy cascade	48
3.2	A brief overview on shell models	49
3.2.1	<i>The model of Desnyansky and Novikov</i>	51
3.2.2	<i>The model of Gledzer, Ohkitani and Yamada (the GOY model)</i>	52
3.2.3	<i>Hierarchical shell models</i>	56
3.2.4	<i>Continuum limit of the shell models</i>	57
3.3	Dynamical properties of the GOY models	58
3.3.1	<i>Fixed points and scaling</i>	58
3.3.2	<i>Transition from a stable fixed point to chaos</i>	60
3.3.3	<i>The Lyapunov spectrum</i>	65
3.4	Multifractality in the GOY model	68
3.4.1	<i>Anomalous scaling of the structure functions</i>	68
3.4.2	<i>Dynamical intermittency</i>	71
3.4.3	<i>Construction of a 3D incompressible velocity field from the shell models</i>	73
3.5	A closure theory for the GOY model	74
3.6	Shell models for the advection of passive scalars	78
3.7	Shell models for two-dimensional turbulence	83
3.8	Low-dimensional models for coherent structures	88

<b>Chapter 4</b>	<b>Turbulence and coupled map lattices</b>	<b>91</b>
4.1	Introduction to coupled chaotic maps	92
4.1.1	<i>Linear stability of the coherent state</i>	93
4.1.2	<i>Spreading of perturbations</i>	94
4.2	Scaling at the critical point	97
4.2.1	<i>Scaling of the Lyapunov exponents</i>	97
4.2.2	<i>Scaling of the correlation length</i>	99
4.2.3	<i>Spreading of localized perturbations</i>	101
4.2.4	<i>Renormalization group results</i>	104
4.3	Lyapunov spectra	106
4.3.1	<i>Coupled map lattices with conservation laws</i>	107
4.3.2	<i>Analytic results</i>	110
4.4	Coupled maps with laminar states	112
4.4.1	<i>Spatio-temporal intermittency</i>	112
4.4.2	<i>Invariant measures and Perron–Frobenius equation of CML</i>	114
4.4.3	<i>Mean field approximation and phase diagram</i>	115
4.4.4	<i>Direct iterates and finite size scaling</i>	118
4.4.5	<i>Spatial correlations and hyperscaling</i>	121
4.5	Coupled map lattices with anisotropic couplings	123
4.5.1	<i>Convective instabilities and turbulent spots</i>	123
4.5.2	<i>Coherent chaos in anisotropic systems</i>	128
4.5.3	<i>A boundary layer instability in an anisotropic system</i>	131
4.5.4	<i>A coupled map lattice for a convective system</i>	134
<b>Chapter 5</b>	<b>Turbulence in the complex Ginzburg–Landau equation</b>	<b>138</b>
5.1	The complex Ginzburg–Landau equation	139
5.2	The stability of the homogeneous periodic state and the phase equation	143
5.3	Plane waves and their stability	146
5.3.1	<i>The stability of plane waves</i>	146
5.3.2	<i>Convective versus absolute stability</i>	148
5.4	Large-scale simulations and the coupled map approximation	148
5.5	Spirals and wave number selection	150
5.6	The onset of turbulence	152
5.6.1	<i>Transient turbulence and nucleation</i>	155
5.7	Glassy states of bound vortices	158

5.8	Vortex interactions	161
5.8.1	<i>Microscopic theory of shocks</i>	162
5.8.2	<i>Asymptotic properties</i>	163
5.8.3	<i>Weak shocks</i>	167
5.9	Phase turbulence and the Kuramoto–Sivashinsky equation	168
5.9.1	<i>Correlations in the Kuramoto–Sivashinsky equation</i>	170
5.9.2	<i>Dimension densities and correlations in phase turbulence</i>	171
5.10	Anisotropic phase equation	172
5.10.1	<i>The shape of a spreading spot</i>	173
5.10.2	<i>Turbulent spots and pulses</i>	178
5.10.3	<i>Anisotropic turbulent spots in two dimensions</i>	181
<b>Chapter 6</b>	<b>Predictability in high-dimensional systems</b>	<b>183</b>
6.1	Predictability in turbulence	185
6.1.1	<i>Maximum Lyapunov exponent of a turbulent flow</i>	185
6.1.2	<i>The classical theory of predictability in turbulence</i>	186
6.2	Predictability in systems with many characteristic times	188
6.3	Chaos and butterfly effect in the GOY model	191
6.3.1	<i>Growth of infinitesimal perturbations and dynamical intermittency</i>	191
6.3.2	<i>Statistics of the predictability time and its relation with intermittency</i>	195
6.3.3	<i>Growth of non-infinitesimal perturbations</i>	197
6.4	Predictability in extended systems	200
6.5	Predictability in noisy systems	202
6.6	Final remarks	209
<b>Chapter 7</b>	<b>Dynamics of interfaces</b>	<b>211</b>
7.1	Turbulence and interfaces	211
7.2	The Burgers equation	212
7.3	The Langevin approach to dynamical interfaces: the KPZ equation	215
7.4	Deterministic interface dynamics: the Kuramoto–Sivashinsky equation	219
7.4.1	<i>Cross-over to KPZ behaviour</i>	222
7.4.2	<i>The Kuramoto–Sivashinsky equation in 2+1 dimensions</i>	225
7.4.3	<i>Interfaces in coupled map lattices</i>	227

7.5	Depinning models	231
7.5.1	<i>Quenched randomness and directed percolation networks</i>	231
7.5.2	<i>Self-organized-critical dynamics: the Sneppen model</i>	232
7.5.3	<i>Coloured activity</i>	235
7.5.4	<i>A scaling theory for the Sneppen model: mapping to directed percolation</i>	237
7.5.5	<i>A geometric description of the avalanche dynamics</i>	240
7.5.6	<i>Multiscaling</i>	241
7.6	Dynamics of a membrane	243
<b>Chapter 8</b>	<b>Lagrangian chaos</b>	<b>244</b>
8.1	General remarks	244
8.1.1	<i>Examples of Lagrangian chaos</i>	247
8.1.2	<i>Stretching of material lines and surfaces</i>	251
8.2	Eulerian versus Lagrangian chaos	253
8.2.1	<i>Onset of Lagrangian chaos in two-dimensional flows</i>	255
8.2.2	<i>Eulerian chaos and fluid particle motion</i>	258
8.2.3	<i>A comment on Lagrangian chaos</i>	264
8.3	Statistics of passive fields	265
8.3.1	<i>The growth of scalar gradients</i>	265
8.3.2	<i>The multifractal structure for the distribution of scalar gradients</i>	266
8.3.3	<i>The power spectrum of scalar fields</i>	268
8.3.4	<i>Some remarks on the validity of the Batchelor law</i>	270
8.3.5	<i>Intermittency and multifractality in magnetic dynamos</i>	272
<b>Chapter 9</b>	<b>Chaotic diffusion</b>	<b>277</b>
9.1	Diffusion in incompressible flows	279
9.1.1	<i>Standard diffusion in the presence of Lagrangian chaos</i>	279
9.1.2	<i>Standard diffusion in steady velocity fields</i>	281
9.1.3	<i>Anomalous diffusion in random velocity fields</i>	283
9.1.4	<i>Anomalous diffusion in smooth velocity fields</i>	284
9.2	Anomalous diffusion in fields generated by extended systems	285
9.2.1	<i>Anomalous diffusion in the Kuramoto–Sivashinsky equation</i>	286
9.2.2	<i>Multidiffusion along an intermittent membrane</i>	290

<b>Appendix A</b>	Hopf bifurcation	292
<b>Appendix B</b>	Hamiltonian systems	294
<b>Appendix C</b>	Characteristic and generalized Lyapunov exponents	301
<b>Appendix D</b>	Convective instabilities and linear front propagation	309
<b>Appendix E</b>	Generalized fractal dimensions and multifractals	315
<b>Appendix F</b>	Multiaffine fields	320
<b>Appendix G</b>	Reduction to a finite-dimensional dynamical system	325
<b>Appendix H</b>	Directed percolation	329
