

# WATER SUPPLY

5th EDITION

ALAN C. TWORT,  
DON D. RATNAYAKA & MALCOLM J. BRANDT

# Contents

Preface	ix
Contributing authors, reviewers and advisors	xi
Abbreviations used in bibliographies	xiii
<b>1. Public water supply requirement and its measurement</b>	<b>1</b>
Consumption categories – difficulties of measuring household consumption – components of domestic demand – fittings usage – standpipe demand – industrial, commercial and agricultural demand – supply meter accuracies – amount of leakage and wastage – distribution losses – price elasticity of demand – growth trends – demand constraint measures – peak consumption rates.	
<b>2. The organisation and financing of public water supplies.</b>	<b>36</b>
Control of public supplies – privatisation in UK – role of Director General of Water Services – the UK Environment Agency – pollution control measures – public water supplies in USA – functions of USEPA – private sector participation – organisation and staffing of undertakings – charging for water – financing of capital works – depreciation and asset management – short- and long-term marginal costing – UK water prices.	
<b>3. Hydrology and surface supplies</b>	
<i>Part I – Hydrological considerations.</i>	<b>63</b>
Catchment areas – streamflow and rainfall measurement – evaporation and transpiration – soil moisture measurement – catchment losses – streamflow naturalisation – minimum and maximum rainfalls and runoffs – flood estimation methods.	
<i>Part II – Yield of surface sources.</i>	<b>87</b>
Definitions of 'yield' – aspects of yield failure risk – river intake yields – use of probability paper – direct supply impounding reservoir yields – yield failure risk by probability methods – pumped storage yields – producing design drought daily flows – regulating reservoir yield – catchwater yields – conjunctive use and operating rules – computer modelling – rainwater collecting systems.	

<b>4. Groundwater supplies</b>	114
Aquifer sources – yield uncertainties – potential yield of an aquifer – assessing aquifer characteristics – recharge assessment – use of Jacob's equation – groundwater modelling – test pumping – geophysical and other investigation methods – borehole linings and gravel packs – borehole construction and development – pollution prevention – artificial recharge – island water supplies – collector wells – borehole and well layouts.	
<b>5. Dams, impounding reservoirs and river intakes</b>	152
Essential reservoir conditions – historic dam failures – design of overflow and outlet works – estimating probable maximum flood – spillway flood routing – drawoff arrangements – earth dam design – gravity dams of concrete and masonry – uplift problems – arch dams – buttress, rockfill and composite dams – seismic considerations – statutory controls – dam deterioration signs – reservoir sedimentation – fish passes – river intakes.	
<b>6. Chemistry, microbiology and biology of water</b>	
<i>Part I – Significant chemicals and physico-chemical parameters in water</i>	197
Key substances in water and water quality parameters – their derivation, incidence and implications.	
<i>Part II – Water quality standards for chemical and physical parameters</i>	221
WHO, EC, UK and USEAP Drinking water standards – comment on their application – classification of raw waters – sampling frequencies – priorities in testing – methods to be used – UK standards for waterworks materials.	
<i>Part III – Water microbiology</i>	240
Waterborne bacterial diseases – cholera, typhoid, dysentery, Legionnaire's disease – protozoal diseases – amoebic dysentery, Cryptosporidiosis, Giardiasis – viral diseases. Use of coliforms for testing – bacteriological standards – tests for total and faecal coliforms – frequency of sampling – test kits – protozoal and virological examinations – nuisance organisms.	
<i>Part IV – Water biology</i>	254
Range of living organisms found in natural waters – algae growth and types – eutrophication effect – problems created in pipelines, treatment works and distribution system.	
<i>Part V – New and emerging issues.</i>	260
Substances and microbiological aspects subject to further evaluation, e.g. MTBE, perchlorate, endocrine disrupters, BSE; and aeromonas, arcobacter, enterovirulent E.Coli and other viruses.	
<b>7. Storage, clarification and filtration of water</b>	
<i>Part 1 – Storage, screening, sedimentation and clarification</i>	267
Raw water storage – screening – sedimentation and settling tanks – chemically assisted clarification – clarifier design – dissolved air flotation – sludge removal – chemical dosing equipment and layout – coagulants and coagulant aids.	
<i>Part II – Water filtration methods and sludge disposal.</i>	317
Rapid filters – design and operation – multilayer filtration – use of anthracite media – granular activated carbon – upward flow filtration – membrane	

	filtration – slow sand filtration – cryptosporidium oocysts and giardia cysts removal – disposal of sludge from treatment works.	
<b>8.</b>	<b>Specialised and advanced water treatment processes</b>	<b>370</b>
	Softening of water – demineralisation – iron and manganese removal – arsenic, lead and aluminium removal – defluoridation and fluoridation – aeration methods – nitrate and ammonia removal by ion exchange, biological or membrane processes – removal of VOC compounds by packed tower aerators, GAC or chemical oxidation – taste and odour removal – micropollutants removal – advanced oxidation processes – corrosion causes and prevention – desalination – removal of radionuclides.	
<b>9.</b>	<b>Disinfection of water</b>	<b>429</b>
	Chlorine and chloramine processes of disinfection – chlorine compounds produced – disinfection efficiency and contact time requirements – production of trihalomethanes – breakpoint and superchlorination – chlorine–ammonia application – chlorine production plant and application – hypochlorite production by electrolysis – chlorine dioxide use – calcium hypochlorite powder – disinfection by ozone – ozone production plant – disinfection by UV radiation – disinfection of water mains and tanks – control of aftergrowth in mains.	
<b>10.</b>	<b>Hydraulics</b>	<b>463</b>
	Energy equation of flow – boundary layer effect – Colebrook–White pipe flow formula – empirical formulae Hazen and Manning’s – fittings loss – open channel flow critical depth of flow – weirs, flumes and gates – non-uniform flow – measurement weirs – measurement flumes – venturi and orifice meters – other flow meters.	
<b>11.</b>	<b>Service reservoirs</b>	<b>499</b>
	Functions and capacity required – economic shape and depth – covering and protecting – structural design of jointed and monolithic reservoirs – drainage and waterproofing – access and protection – pipework – testing for watertightness – searching for leaks – ventilation and instrumentation requirements – water towers.	
<b>12.</b>	<b>Pumping plant: electrical, control and instrumentation systems</b>	<b>522</b>
	Types of centrifugal pumps – characteristics – specific speed – axial flow pumps – reciprocating pumps – electric motor drives – the AC induction motor – starting methods – motor protection – speed control devices – boosting flow or pressure – plant layouts – water hammer protection – suction design and cavitation – efficiencies and fuel consumptions – thermodynamic monitoring of performance – instrumentation and control systems.	
<b>13.</b>	<b>Pipes, pipeline construction and valves</b>	<b>559</b>
	Types of pipes and standard setting organisations – ductile iron pipes and joints – steel pipes – internal and external protection – cathodic protection – polyethylene pipes – PVC pipes – glass reinforced plastic pipes – concrete pipes – asbestos cement pipes – choice of pipes – pipeline construction	

and testing – submarine pipelines – sluice and butterfly valves – flow or pressure control valves – jet dispersers – air valve and washout requirements.

**14. Pipeline and distribution system design and analysis** 613

Functional classification of pipelines – asset management requirements for pipelines – levels of service – economics of pumping main design – gravity main design – break pressure tank – pipeline route planning – distribution system characteristics – design of networks and feed mains – computer modelling of distribution system and network flows – modelling of water quality through distribution system.

**15. Distribution practice** 638

Distribution organisation – fire demand requirements – service pipe materials in use – lead being replaced – copper, steel, PVC, polyethylene – supply meter types, semi-positive and inferential – domestic flow rates for service pipes – fittings headlosses – Regulation requirements – distribution system maintenance and checking performance – mains cleaning, relining, replacing – leakage levels experienced – active leakage control – measurement of field flows – leak location and repair – rehabilitation of systems in disrepair with intermittent supplies.

**Conversion factors** 667

**Index** 669
