<b>CHAPTER 1</b>	<b>Probability and Random Variables</b>	<b>1</b>
1.1	Random Signals	1
1.2	Intuitive Notion of Probability	2
1.3	Axiomatic Probability	4
1.4	Joint and Conditional Probability	12
1.5	Independence	16
1.6	Random Variables	18
1.7	Probability Distribution and Density Functions	20
1.8	Expectation, Averages, and Characteristic Function	23
1.9	Normal or Gaussian Random Variables	28
1.10	Impulsive Probability Density Functions	33
1.11	Multiple Random Variables	34
1.12	Correlation, Covariance, and Orthogonality	41
1.13	Sum of Independent Random Variables and Tendency Toward Normal Distribution	43
1.14	Transformation of Random Variables	47
1.15	Multivariate Normal Density Function	55
1.16	Linear Transformation and General Properties of Normal Random Variables	58
1.17	Limits, Convergence, and Unbiased Estimators	62
<b>CHAPTER 2</b>	<b>Mathematical Description of Random Signals</b>	<b>78</b>
2.1	Concept of a Random Process	78
2.2	Probabilistic Description of a Random Process	81
2.3	Gaussian Random Process	84
2.4	Stationarity, Ergodicity, and Classification of Processes	85
2.5	Autocorrelation Function	87
2.6	Crosscorrelation Function	91
2.7	Power Spectral Density Function	93

2.8	Cross Spectral Density Function	98
2.9	White Noise	99
2.10	Gauss – Markov Process	102
2.11	Random Telegraph Wave	104
2.12	Narrowband Gaussian Process	105
2.13	Wiener or Brownian-Motion Process	108
2.14	Pseudorandom Signals	110
2.15	Determination of Autocorrelation and Spectral Density Functions from Experimental Data	113
2.16	Sampling Theorem	120
2.17	Discrete Fourier Transform and Fast Fourier Transform	121
<b>CHAPTER 3</b>	<b>Response of Linear Systems to Random Inputs</b>	<b>137</b>
3.1	Introduction: The Analysis Problem	137
3.2	Stationary (Steady-State) Analysis	139
3.3	Integral Tables for Computing Mean-Square Value	141
3.4	Pure White Noise and Bandlimited Systems	143
3.5	Noise Equivalent Bandwidth	145
3.6	Shaping Filter	146
3.7	Nonstationary (Transient) Analysis — Initial Condition Response	148
3.8	Nonstationary (Transient) Analysis — Forced Response	150
3.9	Discrete-Time Process Models and Analysis	154
3.10	Summary	158
<b>CHAPTER 4</b>	<b>Wiener Filtering</b>	<b>171</b>
4.1	The Wiener Filter Problem	171
4.2	Optimization with Respect to a Parameter	173
4.3	The Stationary Optimization Problem — Weighting Function Approach	175
4.4	The Nonstationary Problem	186
4.5	Orthogonality	191
4.6	Complementary Filter	192
4.7	Multiple-Input Wiener Filter Problem	197
4.8	Weighting Function Approach to the Sampled-Data Filter	199
4.9	Perspective	201
<b>CHAPTER 5</b>	<b>The Discrete Kalman Filter</b>	<b>210</b>
5.1	A Simple Recursive Example	210
5.2	Vector Description of a Continuous-Time Random Process	212
5.3	Discrete-Time Model	218

5.4	The Discrete Kalman Filter	230
5.5	Examples	236
5.6	The Conditional Density Viewpoint	241
<b>CHAPTER 6</b>	<b>Applications and Additional Topics on Discrete Kalman Filtering</b>	<b>253</b>
6.1	Augmenting the State Vector	253
6.2	Alternative Form of the Discrete Kalman Filter	259
6.3	Sequential Processing of the Measurement Data	264
6.4	Aided Inertial Navigation Systems	265
6.5	Power System Relaying Application	267
6.6	Divergence Problems	271
6.7	Off-Line System Error Analysis	275
6.8	Relationship to Deterministic Least Squares and Note on Estimating a Constant	278
6.9	Telephone Load Forecasting Example	283
6.10	Deterministic Inputs	287
6.11	Perspective	288
<b>CHAPTER 7</b>	<b>The Continuous Kalman Filter</b>	<b>298</b>
7.1	Transition from the Discrete to Continuous Filter Equations	298
7.2	Solution of the Matrix Riccati Equation	303
7.3	Correlated Measurement and Process Noise	306
7.4	Colored Measurement Noise	312
7.5	Suboptimal Error Analysis	317
7.6	Filter Stability in the Steady-State Condition	318
7.7	Relationship Between Wiener and Kalman Filters	321
<b>CHAPTER 8</b>	<b>Discrete Smoothing and Prediction</b>	<b>330</b>
8.1	Prediction	330
8.2	Classification of Smoothing Problems	332
8.3	Discrete Fixed-Interval Smoothing	333
8.4	Discrete Fixed-Point Smoothing	337
8.5	Fixed-Lag Smoothing	340
8.6	Forward – Backward Filter Approach to Smoothing	342
<b>CHAPTER 9</b>	<b>Linearization and Additional Topics on Applied Kalman Filtering</b>	<b>356</b>
9.1	Linearization	356
9.2	Aided Inertial Navigation Systems — The Nonlinear Viewpoint	366

**x** CONTENTS

9.3	Adaptive (Self-Learning) Kalman Filter	372
9.4	Conversion of Continuous Measurements to Discrete Form — The Delayed State Filter Algorithm	380
9.5	U-D Factorization	388
9.6	Schmidt – Kalman Filter. Reducing the Order of the State Vector	393
9.7	Stochastic Linear Regulator Problem and the Separation Theorem	398

**CHAPTER 10** The Global Positioning System: A Case Study 409

10.1	Description of GPS	409
10.2	The Observables	411
10.3	Dynamical Processes and Kalman Filter Modes for a Stand-alone GPS Receiver	414
10.4	Crystal Clock Modeling	424
10.5	Effects of Poor Satellite Geometry	428
10.6	GPS with Internal Aiding	430
10.7	GPS with External Inertial Aiding	437
10.8	Differential Carrier Phase Positioning	441
10.9	Other Areas of Applications	444

**APPENDIX A** Laplace and Fourier Transforms 456

A.1	The One-Sided Laplace Transform	456
A.2	The Fourier Transform	459
A.3	Two-Sided Laplace Transform	461

**APPENDIX B** Typical Navigation Satellite Geometry 470

**APPENDIX C** Kalman Filter Software 474

**INDEX** 500
