IN OPTOELECTRONICS

Lasers

Theory and Practice

J. HAWKES I. LATIMER

Contents

Preface	x
Acknowledgements	xi
List of symbols	xii
1 Energy levels in atoms and molecules	1
1.1 Introduction	1
1.2 The hydrogen atom	6
1.2.1 The Bohr model	6
1.2.2 A quantum-mechanical treatment of the hydrogen atom	9
1.2.3 Spin-orbit coupling	13
1.3 The many-electron atom	14
1.3.1 Exchange parity and the Pauli exclusion principle	14
1.3.2 The central field approximation	15
1.3.3 The Coulomb and spin-orbit interactions	17
1.3.4 The crystal field interaction	21
1.4 Molecular spectra	24
1.4.1 The hydrogen molecule ion	24
1.4.2 The hydrogen molecule	28
1.4.3 Electronic molecular states	28
1.4.4 Vibrational and rotational states	29
1.5 Energy levels in semiconductors	32
1.5.1 The tight binding approximation	32
1.5.2 The nearly free electron model	33
1.5.3 The density of states function	40
1.5.4 Holes	42
1.5.5 Extrinsic semiconductors	42
Problems	43
Notes	45
References	46
2 Light and its properties	47
2.1 The classical wave view of light	47
2.1.1 Plane waves	49
2.1.2 Polarization	51
2.1.3 Propagation in a dielectric medium	51
2.1.4 Energy flow	54
2.1.5 Refractive index variation with frequency	55

2.1.6	The Fresnel equations	59
2.1.7	Propagation of light in dielectric waveguides	63
2.1.8	Reflection of light from metal surfaces	68
2.1.9	Optically anisotropic media	70
2.2	Black-body radiation	76
2.3	The Einstein coefficients	79
2.4	Coherence	85
2.4.1	Temporal coherence	86
2.4.2	Spatial coherence	91
	Problems	92
	Notes	97
	References	98
3	Interaction of light with matter	99
3.1	Transition probabilities	99
3.1.1	Time-dependent perturbation theory	100
3.1.2	The effect of a harmonically varying perturbation	102
3.1.3	The electric dipole interaction	104
3.1.4	Selection rules and higher-order transitions	109
3.1.5	Nonradiative transitions	111
3.1.6	Transitions in semiconductors	112
3.2	Line-broadening mechanisms	117
3.2.1	Radiative (or natural) broadening	118
3.2.2	Power broadening	122
3.2.3	Collision (or pressure) broadening	122
3.2.4	Doppler broadening	127
3.2.5	The Voigt profile	130
3.2.6	The Stokes shift	131
3.3	Optical gain	133
3.3.1	Absorption of a monochromatic beam	133
3.3.2	Gain saturation in homogeneous media	139
3.3.3	Gain saturation in inhomogeneous media	144
3.3.4	Gain in semiconductor media	148
	Problems	151
	Notes	153
	References	154
4	Gaussian beams	155
4.1	Introduction	155
4.2	Ray tracing analysis using matrices	155
4.3	Resonator stability condition	158
4.3.1	Re-entrant ray paths	164
4.4	Diffraction	167
4.5	The paraxial wave equation	170

4.6	Lowest-order TEM ₀₀ mode solution	172
4.7	Physical description of the TEM ₀₀ mode solution	176
4.7.1	The amplitude term and beam divergence	176
4.7.2	Power flux	178
4.7.3	The radial phase term	179
4.7.4	Longitudinal phase factor	180
4.8	Gaussian beams as modes of curved-mirror open resonators	181
4.8.1	Examples of stable resonators	186
4.9	Higher-order Gaussian beam modes	188
4.9.1	Cartesian coordinate solution of the paraxial wave equation	189
4.9.2	Physical properties of Hermite–Gaussian beams	191
4.9.3	Higher-order Laguerre–Gaussian modes	194
4.9.4	Spot size for high-order transverse modes	195
4.10	Propagation of Gaussian beams in optical systems	200
4.10.1	Transformation of a Gaussian beam	200
4.10.2	Application of the ABCD law to optical cavities	202
4.10.3	Application of the ABCD law to focusing and mode matching a Gaussian beam	204
4.11	Elliptical Gaussian beams	209
	Problems	210
	References	212
5	Resonant optical cavities	213
5.1	Introduction	213
5.2	The admittance and interface boundary conditions	214
5.3	Reflectance of thin films	217
5.3.1	Anti-reflection (AR) coatings	221
5.3.2	Multilayer high-reflectance layers	222
5.4	The Fabry–Perot interferometer	224
5.4.1	The plane parallel Fabry–Perot interferometer (FPP)	224
5.4.2	The cavity lifetime	233
5.4.3	The Fabry–Perot interferometer with spherical mirrors (FPS)	237
5.5	Application of the Fabry–Perot interferometer to optical frequency analysis	241
5.6	Ring resonators	244
	Problems	246
	Notes	247
	References	247
	Further reading	247
6	Laser oscillation	249
6.1	Introduction	249

6.2	The threshold condition	250
6.3	Laser power around threshold	253
6.4	Oscillation and gain saturation	258
6.4.1	Homogeneous broadened transition	260
6.4.2	Inhomogeneous broadened transition and the Lamb dip	261
6.4.3	Spatial hole burning	263
6.4.4	Amplified spontaneous emission (the mirrorless laser)	267
6.5	Output power of a laser	269
6.5.1	Uniform field low-gain (lightly coupled) laser	270
6.5.2	Lightly coupled laser with spatial hole burning	273
6.5.3	Large-output coupled laser	275
6.5.4	Inhomogeneously broadened lasers	278
6.5.5	Mixed broadening	279
6.5.6	Methods of measuring the gain and optimum output coupling	280
6.6	Laser output frequency	283
6.6.1	Exact oscillation frequency	283
6.6.2	The laser linewidth	286
6.6.3	Techniques for single-frequency operation	290
6.6.4	Techniques for stabilizing the laser frequency	294
6.6.5	Second harmonic generation	302
	Problems	309
	Notes	311
	References	312
7	Laser excitation and systems	314
7.1	Introduction	314
7.2	Gas lasers	316
7.2.1	Excitation mechanisms in ionized gases	316
7.2.2	Characteristics of electrical discharges	321
7.2.3	The helium–neon lasers	323
7.2.4	Noble gas ion lasers	332
7.2.5	Metal vapour ion lasers	339
7.2.6	Cyclic metal vapour lasers (MVL)	341
7.2.7	Molecular gas lasers	343
7.3	Optically pumped lasers	359
7.3.1	Solid-state lasers	365
7.3.2	Dye lasers	379
7.4	The semiconductor laser	387
7.4.1	The homojunction semiconductor laser	388
7.4.2	Heterojunction structures	394
7.4.3	Gain and index guided lasers	396
7.4.4	Beam divergence	399
7.4.5	Spectral output	401

7.4.6	Distributed feedback structures	404
7.4.7	Quantum well structures	406
7.4.8	Laser diode arrays	407
7.4.9	Materials and manufacturing techniques	408
	Problems	411
	Notes	412
	References	413
8	Transient effects	416
8.1	Relaxation oscillation	416
8.1.1	Effects of pump modulation	423
8.2	<i>Q</i> -switching	425
8.2.1	Theory of <i>Q</i> -switching	425
8.2.2	Techniques for <i>Q</i> -switching	432
8.2.3	Passive <i>Q</i> -switching	440
8.2.4	Repetitive <i>Q</i> -switching	442
8.2.5	Gain switching and cavity dumping	442
8.3	Mode locking	443
8.3.1	Theory of mode locking in inhomogeneously broadened lasers	443
8.3.2	Active mode locking (inhomogeneous lasers)	450
8.3.3	Passive mode locking	452
8.3.4	Active mode locking in homogeneously broadened lasers	455
8.4	The production of ultra-short optical pulses	467
	Problems	471
	Notes	475
	References	476
Appendix 1	Quantum mechanics	479
Appendix 2	Spherical harmonics	487
Appendix 3	Propagation in planar dielectric waveguides	489
Appendix 4	The Wiener–Khintchine theorem	495
Appendix 5	The condition for direct optical transitions between conduction bands and valence bands	497
Appendix 6	Error signal using third harmonic of frequency-modulated signal	499
Appendix 7	Optical heterodyne detection	501
Appendix 8	Laser safety	502
Appendix 9	Physical constants and properties of some common semiconductors at room temperature	508
