

CONTINUOUS SYSTEM SIMULATION

D. J. MURRAY-SMITH

CHAPMAN & HALL

CONTENTS

Preface	xi
1 The principles of modeling	1
1.1 Objectives in the modeling of systems	1
1.2 Continuous-variable and discrete-event models	2
1.3 Types of continuous-variable model	3
1.4 Modeling and simulation procedures for continuous-variable models	4
References	11
2 An introduction to simulation methods	13
2.1 The need for simulation	13
2.2 Methods of simulation	14
2.2.1 Techniques based on special-purpose simulation hardware	14
2.2.2 Techniques based on general-purpose computer hardware	16
2.3 A review of simulation applications	18
References	21
3 Problem organization for continuous system simulation	23
3.1 Introduction	23
3.2 Descriptions for continuous-variable models: reduced and state-variable forms	24
3.3 Conversion from reduced form to state-variable form	25
3.4 Transfer function descriptions	26
3.5 Bond graph representations	27
3.5.1 One-port components	27
3.5.2 Causality in bond graph representations	27
3.5.3 Junctions in bond graphs	28
3.5.4 Coupling between physical domains	29
3.5.5 Signals in bond graphs	30
3.5.6 Simulation program development from bond graph models	30
3.6 Block diagram and signal flow graph representations	31
3.7 Block diagram and signal flow graph methods for transfer function simulation	32
3.7.1 The direct construction approach	33
3.7.2 The parallel construction approach	35
3.7.3 The iterative construction approach	36
3.7.4 An example of block diagram construction from a transfer function	37

3.8	Modeling of distributed parameter elements	39
3.8.1	Introduction	40
3.8.2	Pure time delay	41
3.8.3	Distributed time delay	41
3.8.4	Simulation models involving pure and distributed delay elements	41
3.9	Parameter sensitivity analysis methods in system modeling and simulation	42
3.9.1	Methods for sensitivity co-system simulation	43
3.10	Mathematical models of systems having both discrete and continuous elements	47
	References	49
4	The principles of numerical modeling	51
4.1	An introduction to numerical integration methods	51
4.2	Fixed-step integration algorithms: one-step methods	52
4.2.1	Introduction	53
4.2.2	Taylor series descriptions	53
4.2.3	Errors in fixed-step integration methods	56
4.2.4	Explicit Runge-Kutta methods	57
4.2.5	Trapezoidal integration	60
4.3	Fixed-step integration algorithms: multistep methods	60
4.4	Problems of integration step-size selection and numerical instability	61
4.5	Variable-step integration algorithms	62
4.6	Problems of 'stiff' models	62
4.7	Discontinuities and their effects	63
4.7.1	Numerical methods for discontinuous problems	64
4.8	Problems of implicit loop structures	66
	References	66
5	Sampled-data models and operator methods	67
5.1	Introduction	67
5.2	Approximations based on sampled-data theory	67
5.3	Modeling of linear systems using sampled-data approximations	69
5.3.1	Cascaded elements	69
5.3.2	Closed-loop systems	70
5.4	Modeling of nonlinear systems using sampled-data approximations	70
5.4.1	Cascaded elements	70
5.4.2	Closed-loop models	73
5.5	Sampled-data description for a continuous state-space model	74
5.5.1	Linear time-invariant models	74
5.6	Operational methods for difference equation models	75
5.6.1	Integration operators	75
5.7	Simulation using operational methods	76
5.7.1	Simulation of a single transfer function	76
5.7.2	Simulation of cascaded transfer functions	77
5.7.3	Simulation of linear closed-loop systems	80
5.7.4	Simulation of time-varying and nonlinear models by operator methods	81
5.8	Assessment of simulation performance by frequency response methods	83

5.8.1	Frequency response of discrete integrators	83
	References	84
6	The principles of equation-oriented simulation software	85
6.1	Introduction	85
6.2	Simulation programming using general-purpose high-level languages	85
6.3	Simulation programming using matrix packages	86
6.4	Simulation packages	87
6.5	Simulation programming using simulation languages	87
6.5.1	Introduction	87
6.5.2	The Simulation Councils' 1967 recommendations (CSSL'67)	87
6.5.3	The general structure of simulation programs using CSSL'67-type languages	88
6.6	SLIM – a simple continuous system simulation language	91
6.6.1	The main features of the language	91
6.6.2	The syntax of the SLIM language	92
6.6.3	Output facilities and graphics	97
6.6.4	An example of a simulation program in the SLIM language	97
6.7	Examples of other simulation languages	101
6.7.1	CSSL IV	101
6.7.2	ACSL	103
6.7.3	DESIRE	104
6.8	Comparisons of SLIM with widely used simulation languages	105
	References	107
7	The principles of block diagram-oriented simulation tools	109
7.1	Graphical man-machine interfaces for simulation	109
7.2	The block-based approach to the description of dynamic systems	110
7.3	Examples of block-oriented simulation environments with a graphical user interface	111
7.4	A simple simulation example using graphical block-oriented tools	113
	References	115
8	Simple examples using common simulation tools	117
8.1	Introduction	117
8.2	A coupled-tuned electrical circuit simulation	117
8.3	A control system simulation: speed control of a water turbine	121
8.4	Simulation of a neural encoder model	125
8.5	A constrained pendulum simulation	129
8.6	Simulation of a simple digital control system	131
	References	138
9	Internal verification and external validation	141
9.1	The need for testing	141
9.2	Terminology and definitions	142
9.3	Internal verification	142

viii *Contents*

9.3.1	Static checks	143
9.3.2	Dynamic checks	143
9.4	External validation	144
9.4.1	Theoretical validity	144
9.4.2	Empirical validity	145
9.4.3	Measured response information for empirical validation	147
9.4.4	System identification and parameter estimation methods in the empirical validation process	148
9.5	Robustness issues in external validation	149
9.6	Possible outcomes of the external validation process	150
9.7	Documentation of the validation process	150
	References	151
10	Case study I – a two-tank liquid level control system	153
10.1	Introduction	153
10.2	Modeling of a pair of interconnected tanks	154
10.2.1	A nonlinear mathematical model	155
10.2.2	Linearization of the model	156
10.3	Programs for simulation of the nonlinear coupled-tank system	157
10.3.1	Internal verification of the simulation program	158
10.3.2	External validation of the simulation model	160
10.4	Discussion	162
	Reference	162
11	Case study II – an aircraft automatic landing system	163
11.1	Introduction	163
11.2	Modeling and simulation of an aircraft directional-control system	165
11.3	Modeling and simulation of a lateral beam guidance system	169
11.4	Discussion	173
	References	173
12	Case study III – respiratory gas-exchange process simulation	175
12.1	Introduction and background physiology	175
12.2	Modeling of pulmonary gas-exchange processes	176
12.3	The computer simulation	179
12.4	Discussion	182
	References	184
13	Case study IV – a simulation model of active skeletal muscle	187
13.1	Introduction	187
13.2	Models of active muscle	189
13.2.1	Simulation of active muscle for constant length conditions	192
13.2.2	Models of active muscle for constant tension conditions and simulation of the after-loaded isotonic twitch	193
13.3	Parameter sensitivity analysis	196

13.4 Simulation of the complete twitch response and repetitive stimulation	203
13.5 Discussion	204
References	205
14 Real-time simulation	207
14.1 An introduction to real-time applications	207
14.2 Hardware and software aspects of real-time simulation	208
14.3 Analog simulation techniques	209
14.3.1 The operational amplifier	210
14.3.2 The summing unit	211
14.3.3 The integrator unit	211
14.3.4 The coefficient unit	212
14.3.5 Multipliers and other nonlinear units	213
14.3.6 Scaling of variables	213
14.3.7 Operating modes	217
14.4 Digital techniques	217
14.4.1 Real-time integration algorithms	217
14.4.2 Choice of communication interval	219
14.4.3 Error analysis in real-time simulation	220
14.4.4 Multirate methods	220
14.5 Special-purpose hardware for real-time digital simulation	221
14.5.1 Introduction	221
14.5.2 Array processors and multiprocessor systems	221
14.5.3 Transputer-based parallel systems	222
14.6 Hardware-in-the-loop simulation and partial-system testing	222
14.7 Applications in training and education	223
14.7.1 Introduction	223
14.7.2 Simulators for operator training	224
14.7.3 Real-time simulation in teaching	225
References	226
15 Current trends in continuous system simulation	227
15.1 Developments in simulation languages	227
15.2 Improvements in the man-machine interface	228
15.3 Developments involving parallel processor systems	229
15.3.1 Hardware developments in parallel processing for simulation	229
15.3.2 Simulation software for parallel processor systems	230
15.4 Artificial intelligence and simulation	230
15.4.1 Knowledge-based systems in modeling and simulation	231
15.4.2 Knowledge representation using frames and inheritance	231
15.4.3 Qualitative modeling and qualitative simulation	232
References	233
Appendix A The Laplace transform	235
A.1 Introduction	235
A.2 Linearity theorem	235

x *Contents*

A.3 Differentiation theorem	235
A.4 Final value theorem	236
A.5 Example	236
Reference	236
Appendix B The transfer function	237
Reference	237
Appendix C Block diagrams and signal flow graphs	239
C.1 Introduction	239
C.2 Block diagrams	239
C.3 Signal flow graphs	241
Reference	242
Appendix D Discrete-time models and sampled-data theory	243
D.1 Introduction	243
D.2 Discrete-time models	243
D.3 Discretization of a continuous-time model	243
D.4 The sampling process	244
References	246
Appendix E SLIM software instructions	247
E.1 Introduction	247
E.2 Hardware requirements	247
E.3 Software installation	247
E.4 Starting and exiting SLIM	248
E.5 Useful hints for using SLIM	248
E.6 Starting and exiting SLIMPLOT	249
E.7 Useful hints for using SLIMPLOT	249
Index	251
